# The need for MC

⇒ New analysis will need new/Run2 MC. Already in progress:

# The need for MC - improvements

⇒ If you recall in Run1 we had PHSP MC:

⇒ More flat makes our life easier and less dirty in terms of reweighing :)

⇒ Produced 20M events so we can get the correction for small "non-flatness". (will give you links at the end).

# The data

- ⇒ Reprocessed all the data with the same DV. Both 201(1,2,5,6) data sets.
- ⇒ Also reprocessed all MC for Run1. Run2 scripts are written and will be lunch as soon the production finishes
- ⇒ First look at data:

$$N_{J/\psi K^*}^{Run1} = 641446$$

$$N_{J/\psi K^*}^{2015} = 106149$$

$$N_{J/\psi K^*}^{2016} = 626024$$

# The data- comparing distributions

⇒ Over all we see a very good agreement between the year:

B\_DiraCos

B\_IPCHI2\_OWNPV

# The data- comparing distributions

⇒ Over all we see a semi good agreement between the year:

B\_ENDVERTEX\_CHI2

B\_P

B\_IP\_OWNPV

B\_PT

# The data- comparing distributions

⇒ Over all we see a semi good agreement between the year:

J\_psi\_ENDVERTEX\_CHI2

J\_psi\_IP\_OWNPV

J\_psi\_P

# The data- comparing distributions

⇒ Over all we see a semi good agreement between the year:

K\_IPCHI2\_OWNPV

K\_P

K\_IP\_OWNPV

K\_PT

# The data- comparing distributions

⇒ Over all we see a semi good agreement between the year:

Pi\_IPCHI2\_OWNPV

Pi\_IP\_OWNPV

Pi\_P

Pi\_PT

# The data- comparing distributions

⇒ Over all we see a semi good agreement between the year:

mu\_minus\_IPCHI2\_OWNPV

mu\_minus\_IP\_OWNPV

mu\_minus\_P

mu\_minus\_PT

# Selection

⇒ Now we had the pre selection developed for Run1!

⇒ Known VETOS:

- Swaps with  $B \rightarrow K^* J/\psi$
- $\Lambda_b$
- Random pion in  $B \rightarrow K\mu\mu$ .
- $B_s^0 \rightarrow \phi\mu\mu$ .

⇒ The same triggers as Run1. Need MC to check it for Run2. Have script read to calculate everything so next week we will have numbers.

# Selection

⇒ We have missed one cut unfortunately.

⇒ Normally we have the swap for  $J/\psi$ :

"!( (B0\_swapMass>3036) and (B0\_swapMass<3156) and (Pi\_PIDmu>5||Pi\_isMuon==1)) and !( (B0\_kmuswapMass>3036) and (B0\_kmuswapMass<3156) or (K\_PIDmu>5||K\_isMuon==1))"

⇒ We forgot about the  $\psi(2S)$ :

⇒ Impact for the Pwave analysis minimal but let's veto just to be sure :)

⇒ The  $m_{K\pi}$  preselection cut increased to 1530 MeV to cover the future moments analysis.

# Ongoing

- ⇒ Downloaded all the needed PIDCalib samples for re sampling. First re sampled distributions should be ready next week.
- ⇒ EOS TOYS generated. Need to calculate the integrated observables.
- ⇒ BDT strategies: Keep variables as they are and don't spend too much time on this. Run2 needs separate BDT: small studies planned MC vs DATA training.

# What we have

⇒ All ntuples are on eos:

/eos/lhcb/user/m/mchrzasz/KstarMuMu

- data w/o selection
- data after selection
- TOY MC: EOS + FlatQ2
- Run1 MC
- Run MC(will be copied once it's ready)
- PIDCalib samples.
