# LHCb detector

LHCb is a forward spectrometer:

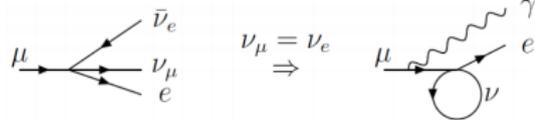

- Excellent vertex resolution.
- Efficient trigger.
- High acceptance for  $\tau$  and B.
- Great Particle ID

# Lepton Flavour/Number Violation

## Lepton Flavour Violation(LFV):

After  $\mu^-$  was discovered it was natural to think of it as an excited  $e^-$ .

- Expected:  $B(\mu \rightarrow e\gamma) \approx 10^{-4}$
- Unless another  $\nu$ , in intermediate vector boson loop, cancels.

I.I.Rabi:

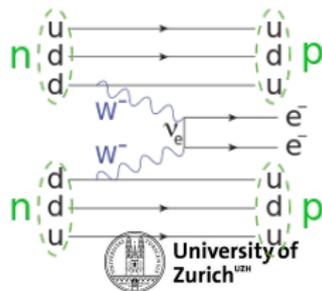

"Who ordered that?"

- Up to this day charged LFV is being searched for in various decay modes.
- LFV was already found in neutrino sector (oscillations).

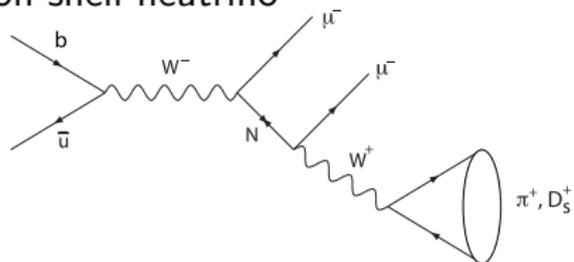

## Lepton Number Violation (LNV)

- Even with LFV, lepton number can be a conserved quantity.
- Many NP models predict its violation (Majorana neutrinos)
- Searched in so called Neutrinoless double  $\beta$  decays.

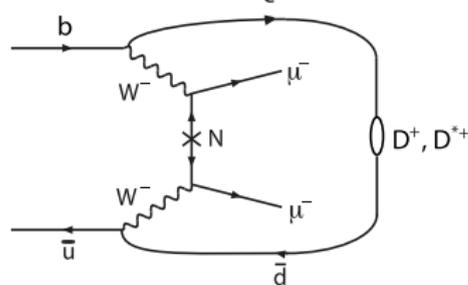

# LVN in bottom decays

on-shell neutrino

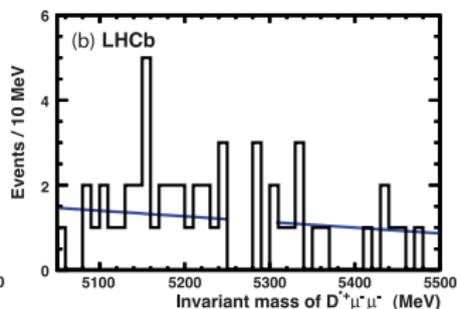

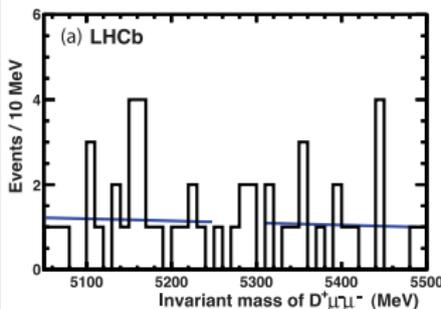

virtual neutrino

- resonant production in accessible mass range
- rates depend on Majorana neutrino–lepton coupling  $|V_{\mu 4}|$  (e.g. arXiv:0901.3589)
- $m_4 = m_{\ell^-, \pi^+}$
- $m_\mu + m_\pi < m_4 < m_B - m_\mu$

Diagram without mass restriction  
Cabbibo favoured for  $B \rightarrow D$   
Analogous to double  $\beta$  decay.

# Virtual Majorana neutrinos

$$\mathcal{B}(B^- \rightarrow D^+ \mu^- \mu^-) < 6.9 \times 10^{-7}$$

@ 95 % CL  
Based on  $0.41 \text{ fb}^{-1}$  7 TeV data.

$$\mathcal{B}(B^- \rightarrow D^{*+} \mu^- \mu^-) < 2.4 \times 10^{-6}$$

@ 95 % CL

Phys. Rev. D85 (2012)  
112004

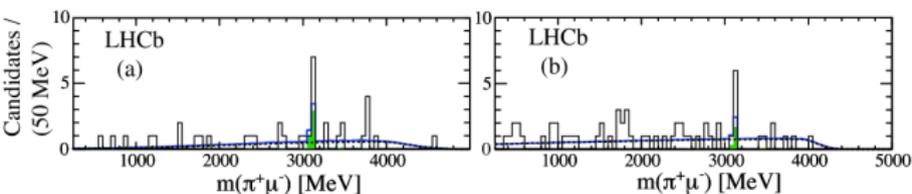

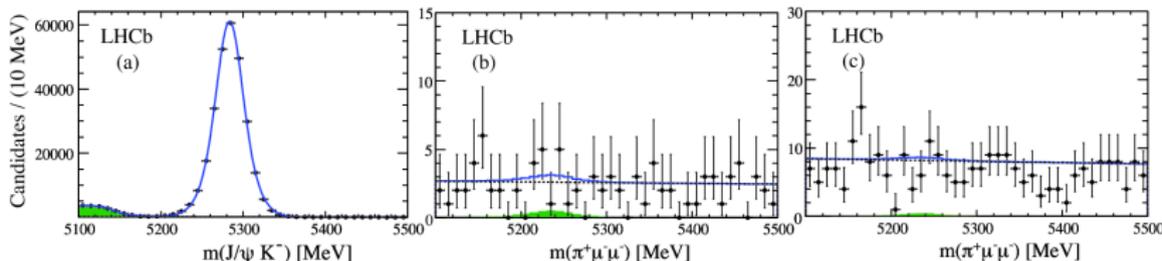

University of  
Zurich<sup>ZH</sup>

# On-shell Majorana neutrinos

- $B^- \rightarrow \pi^+ \mu^- \mu^-$  searched with full data set  $3 \text{ fb}^{-1}$ .
- Cut based analysis.
- Normalization channel  $B^+ \rightarrow J/\psi(\mu\mu)K^+$ .
- Searches performed for two scenarios:
  - Short life-time neutrinos:  $\tau_4 < 1 \text{ ps}$
  - Long life-time neutrinos:  $\tau_4 \in (1, 1000) \text{ ps}$

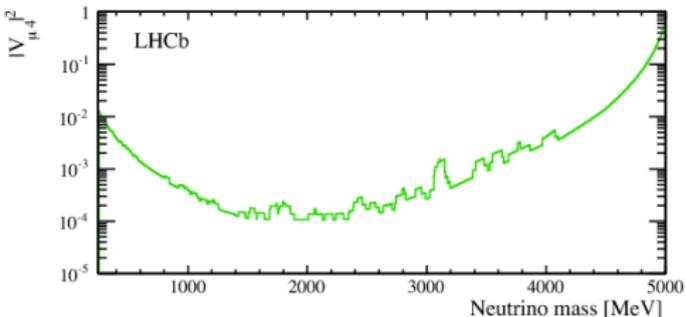

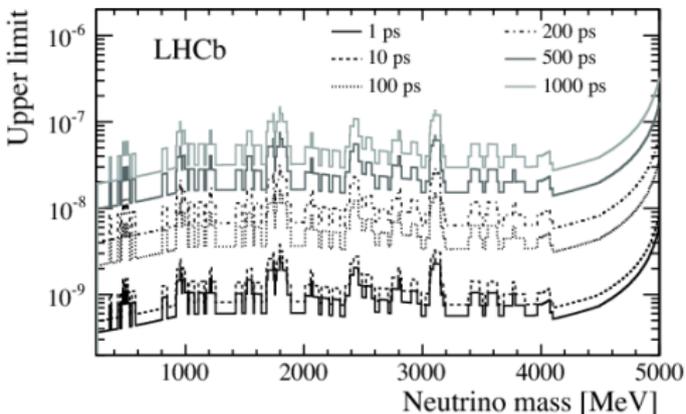

Phys. Rev. Lett. 112,  
131802

University of  
Zurich<sup>ETH</sup>

# On-shell Majorana neutrinos

- In absence of signal UL. were set.
- $Br(B^- \rightarrow \pi^+ \mu^- \mu^-)$  in range  $10^{-9}$ .
- Limits also set for the coupling  $|V_{\mu 4}|^2$

$$Br(B^- \rightarrow \pi^+ \mu^- \mu^-) = \frac{G_f^4 f_B^2 f_\pi^2}{128\pi\hbar} \tau_B m_B^5 |V_{ub} V_{ud}|^2 |V_{\mu 4}|^4 \left(1 - \frac{m_4^2}{m_B^2}\right) \frac{m_4}{\Gamma_{N_4}}$$

# Summary on LNV in B decays

channel	limit

$$B_{(s)} \rightarrow e^- \mu^+$$

- A separate physics interest is LFV B decays.
- Predicted by various NP models: lepto-quarks, SUSY, GUT.
- Analysis based on  $1 \text{ fb}^{-1}$  2011 data.
- Analogous to our  $B_s^0 \rightarrow \mu\mu$  analysis (PRL 111 (2013) 101804)

- 1 Loose preselection based on topology and PID.
- 2 Classifier trained on MC signal and  $b\bar{b} \rightarrow \ell\ell X$
- 3 Calibration channel:  $B^0_{(s)} \rightarrow h^+ h'^-$
- 4 Normalization Channel:  $B^0 \rightarrow K^+ \pi^-$
- 5  $CLs^1$  method for limit extraction.

Journal of Physics G (2012)

# $B_{(s)} \rightarrow e^- \mu^+$ mass calibration

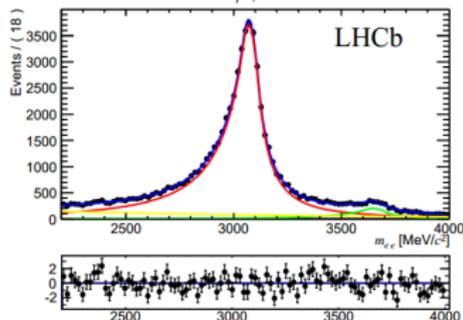

LHCb philosophy: data driven approach when/where possible.

- Electrons undergo Bremsstrahlung  $\rightarrow$  recover the lost energy.
- Re-weight MC to match event multiplicity.
- Parametrize signal shape by Crystal Ball.
- Validate the approach on  $J/\psi \rightarrow e^- e^+$ .
- Observe agreement between data and MC  $J/\psi$  line shape.

Simulation:  $J/\psi \rightarrow e^+ e^-$  (not re-weighted)

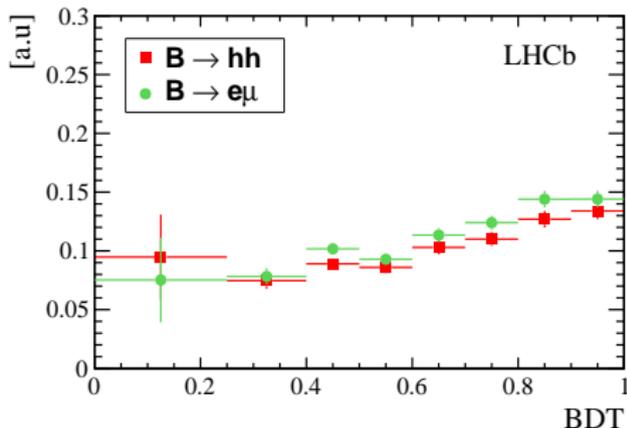

Data:  $J/\psi \rightarrow e^+ e^-$

# $B_{(s)} \rightarrow e^- \mu^+$ BDT calibration

- Hadronic two body B decays are an excellent proxy!
- Same topology and kinematics.
- Select an inclusive sample of  $B_{(s)} \rightarrow h^+ h'^-$
- Apply BDT to selected hadronic sample and correct MC signal efficiency:

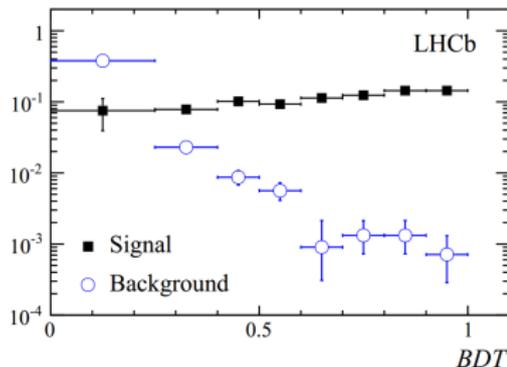

$$\epsilon_{DATA}^{sig} = \frac{\epsilon_{DATA}^{norm}}{\epsilon_{MC}^{norm}} \times \epsilon_{MC}^{sig} \quad (1)$$

- 1  $B_{(s)} \rightarrow h^+ h'^-$  BDT shape in data.
- 2  $B_{(s)} \rightarrow e\mu$  BDT shape after corrections.

# $B_{(s)} \rightarrow e^- \mu^+$ background

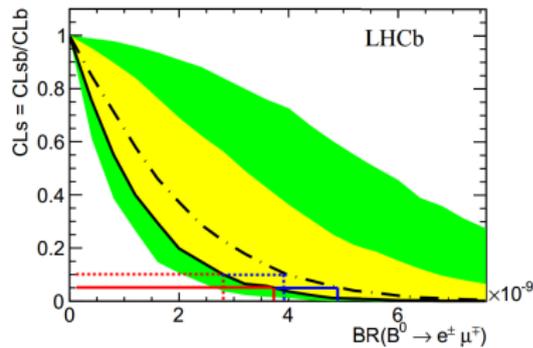

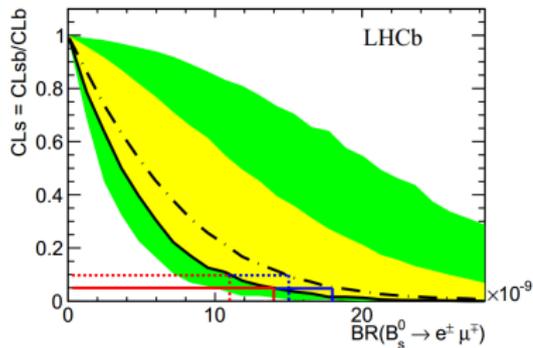

- Number of expected background candidates extrapolated from side bands:  $[4, 9, 5.0] \cup [5.5, 5.9]$  GeV
- Peaking backgrounds:
  - $B_{(s)} \rightarrow h^+ h^-$ , model using miss ID rates. Expect 4 events in the full BDT range.

- Semileptonic backgrounds:
  - $\Lambda_b \rightarrow p \mu \nu$
  - $B \rightarrow \pi \mu \nu$
  - $B_c^+ \rightarrow J/\psi(\mu\mu)e\nu$
  - $B_c^+ \rightarrow J/\psi(ee)\mu\nu$
- Can be modelled in a fit

BDT	Expected from sideband fit	$B_{(s)}^0 \rightarrow h^+ h'^-$	Observed
0-0.25	$2222 \pm 51$	$0.67 \pm 0.12$	2332
0.25-0.4	$80.9^{+10.1}_{-9.4}$	$0.47 \pm 0.09$	90
0.4-0.5	$20.4^{+5.0}_{-4.5}$	$0.40 \pm 0.08$	19
0.5-0.6	$13.2^{+3.9}_{-3.6}$	$0.37 \pm 0.06$	4
0.6-0.7	$2.1^{+2.9}_{-1.4}$	$0.45 \pm 0.08$	3
0.7-0.8	$3.1^{+1.9}_{-1.4}$	$0.49 \pm 0.08$	3
0.8-0.9	$3.1^{+1.9}_{-1.4}$	$0.57 \pm 0.09$	3
0.9-1.0	$1.7^{+1.4}_{-1.0}$	$0.54 \pm 0.12$	1

$$B_{(s)} \rightarrow e^- \mu^+$$

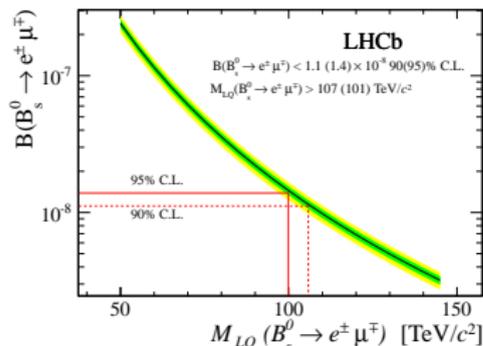

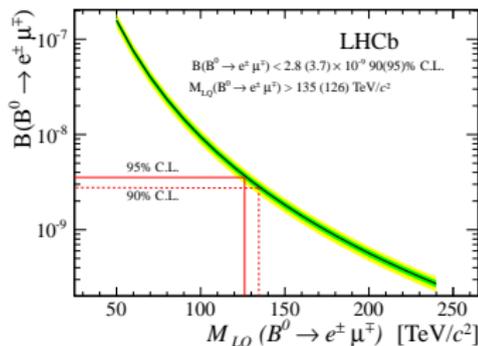

Upper limits

	$Br(B \rightarrow e\mu)$ @ 90(95)%CL	$Br(B_s \rightarrow e\mu)$ at 90(95)%CL
Expected	$3.8(4.8) \times 10^{-9}$	$1.5(2.0) \times 10^{-8}$
Observed	$1.5(1.8) \times 10^{-9}$	$1.1(1.4) \times 10^{-8}$

# $B_{(s)} \rightarrow e^- \mu^+$ Implications

- LHCb limits two times better than previous ones from CDF<sup>2</sup>.
- CDF implications to lepto-quarks mass<sup>3</sup>.
  - $m_{LQ}(B_s^0 \rightarrow e\mu) > 47.8(44.9) \text{ TeV}$  90(95%) @CL.
  - $m_{LQ}(B^0 \rightarrow e\mu) > 59.3(56.3) \text{ TeV}$  90(95%) @CL.

LHCb limits:

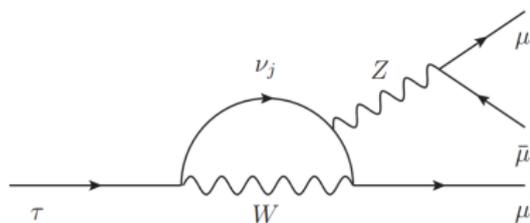

- $m_{LQ}(B_s^0 \rightarrow e\mu) > 107(101) \text{ TeV}$  90(95%) @CL.
- $m_{LQ}(B^0 \rightarrow e\mu) > 135(126) \text{ TeV}$  90(95%) @CL.

<sup>3</sup>Theoretical formula Phys. Rev. D 50 (1994) 6843

# $\tau \rightarrow \mu\mu\mu$

- 1 In SM small  $\mathcal{B}(\tau^- \rightarrow \mu^- \mu^- \mu^+) \sim 10^{-40}$
- 2 NP can enhance  $\mathcal{B}$ .
- 3 Nature still hides  $\tau^- \rightarrow \mu^- \mu^- \mu^+$  from us.
- 4 Current limits:

Experiment	90% CL limit
BaBar <sup>4</sup>	$3.3 \times 10^{-8}$
Belle <sup>5</sup>	$2.1 \times 10^{-8}$

- Can a hadron collider change the picture?

<sup>4</sup>Phys.Rev.D81:111101(R),2010

<sup>5</sup>Phys.Lett.B687:139-143,2010

## $B$ factories

- 1 signal:  $e^+e^- \rightarrow \tau^+\tau^-$
- 2  $1.2 \times 10^9$   $\tau$  pairs
- 3 Calculate the thrust axis
- 4 Tag the other  $\tau$
- 5 Small cross section  $0.919nb$

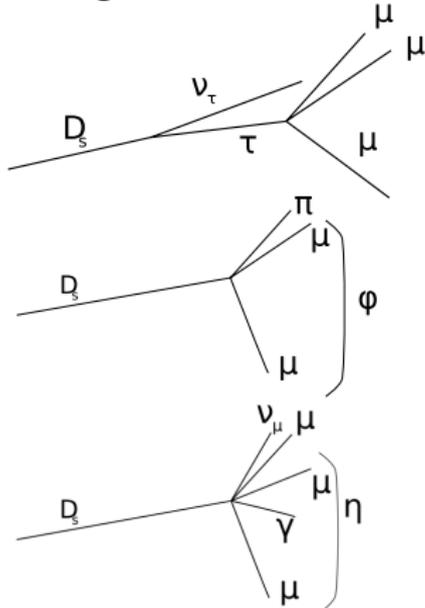

## LHCb, (7 TeV, 2011 data)

- 1 Inclusive  $\tau$  cross section:  
 $79.5 \pm 8.3 \mu b$ .
- 2  $8 \times 10^{10}$   $\tau$  produced.
- 3 Dominant contribution:  
 $D_s \rightarrow \tau \nu_\tau$  (78%)
- 4 No partial tag possible.

- Loose cut based selection
- Classification in 3D space:
  - invariant mass
  - decay topology (multivariate)
  - particle identification (multivariate)
- Classifier trained on simulation
- Calibration with control channel
- Normalization with  $D_s \rightarrow \phi(\mu\mu)\pi$
- CLs method to extract the result

Signal & Calibration & Background channel:

## particle identification

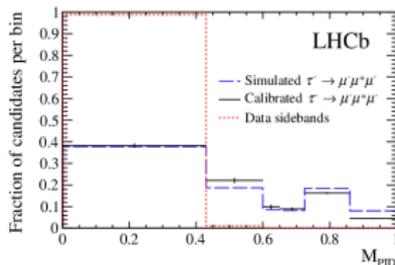

- hits in muon chambers
- energy in calorimeters
  - compatible with MIP
- RICH response

## 3 body decay likelihood

- vertex properties
  - vertex fit, pointing
- track quality
- isolation

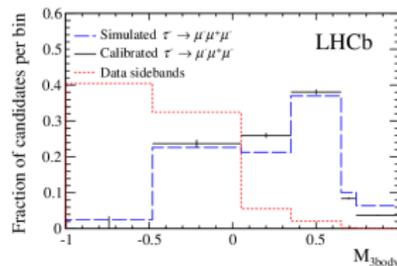

## Calibration

$$J/\psi \rightarrow \mu^+ \mu^-$$

## Calibration

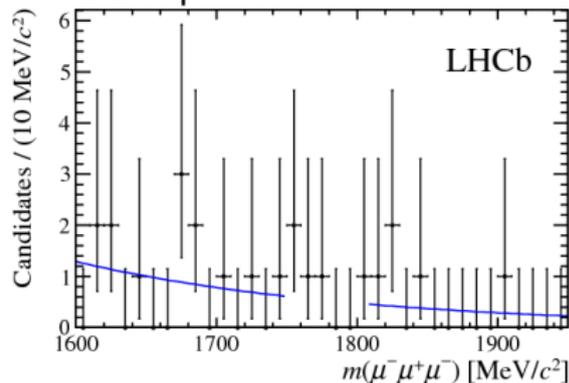

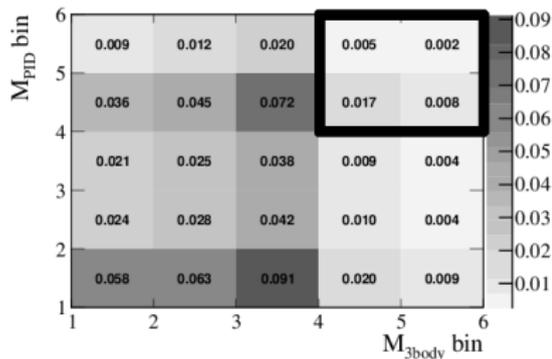

$$D_s \rightarrow \phi\pi$$

## combined signal distribution

- events distributed over 25 likelihood bins
- background estimate from mass side-bands

Signal efficiency in 3-BODY BDT vs PID BDT plane.

# Extracted upper limit

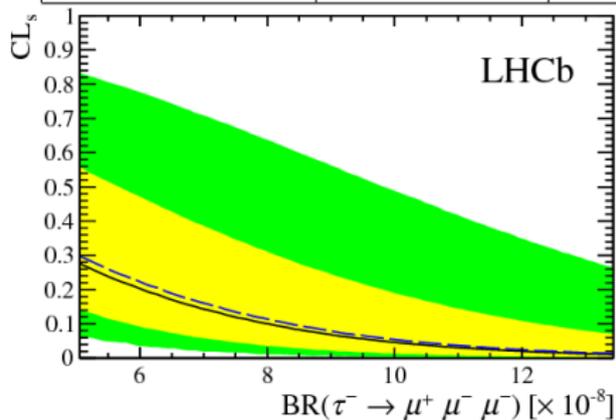

1 fb<sup>-1</sup>

PLB 724

(2013) 36-45

Upper limits			
	observed	expected	CL
$\mathcal{B}(\tau \rightarrow \mu\mu\mu)$	$8.0 \times 10^{-8}$	$8.3 \times 10^{-8}$	90%
	$9.8 \times 10^{-8}$	$10.2 \times 10^{-8}$	95%

- Analyses of LFV and LNV processes are going very well in LHCb
- We already have a number of best limits in our hands.
- Stay tuned, more new results coming up soon.
