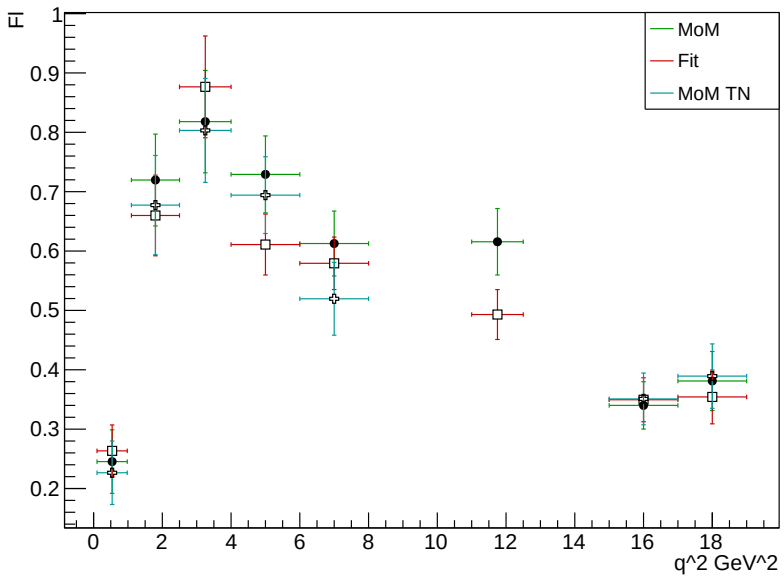
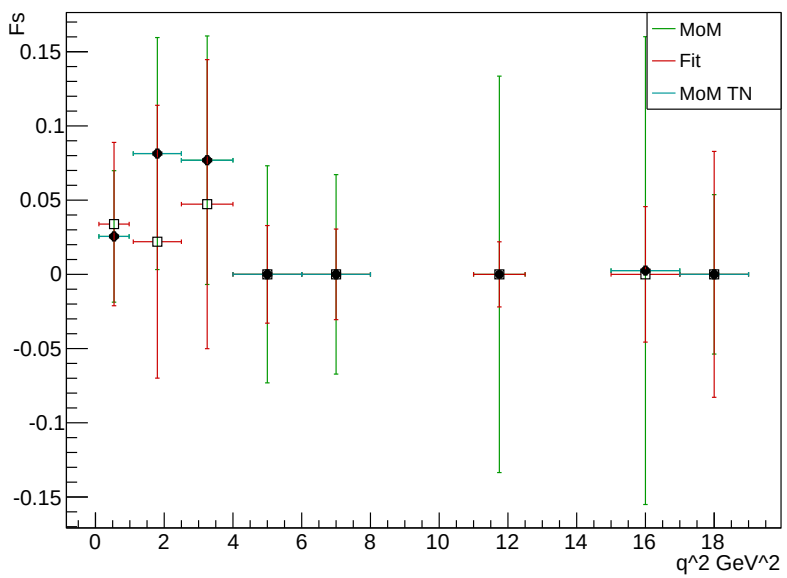
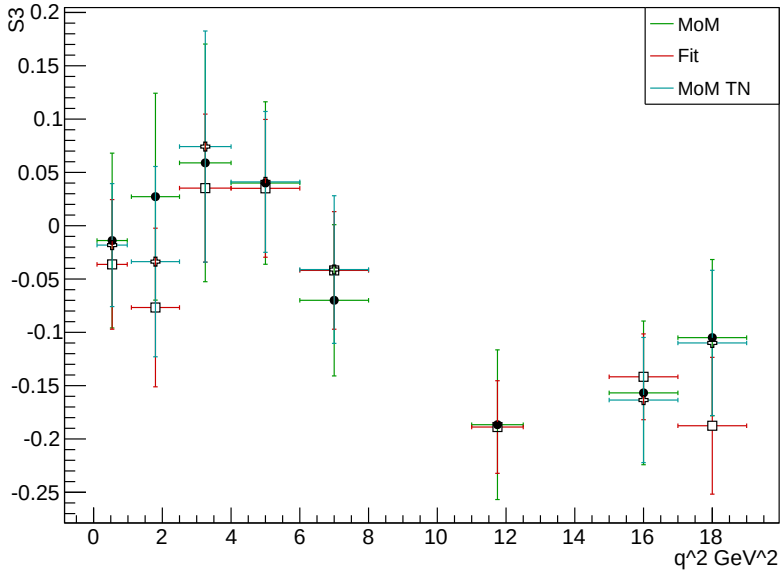
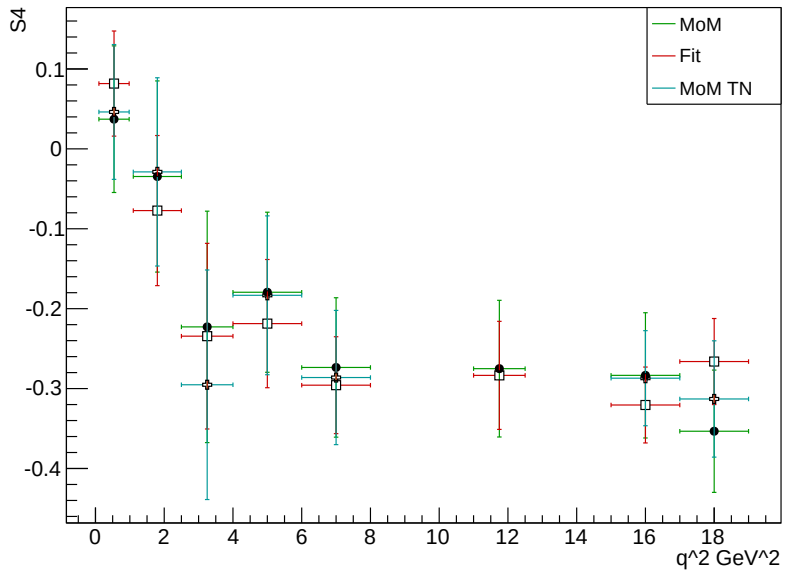
Comparison MoM with LL fit



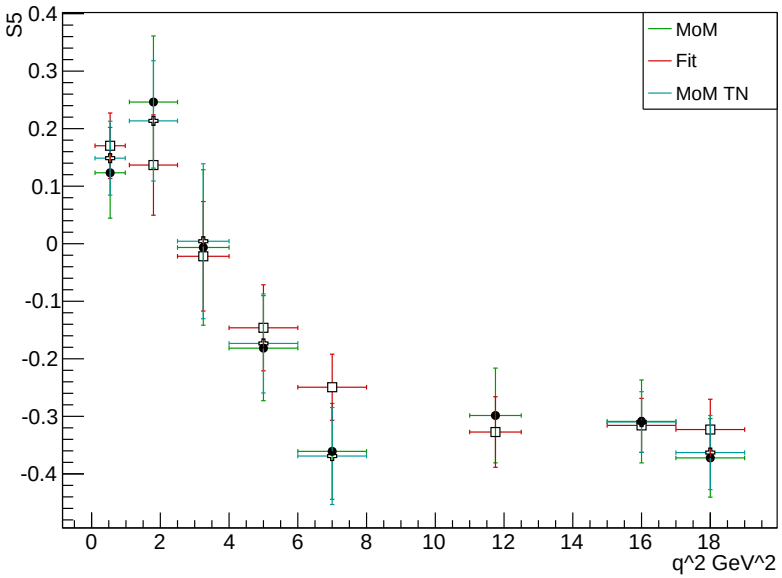


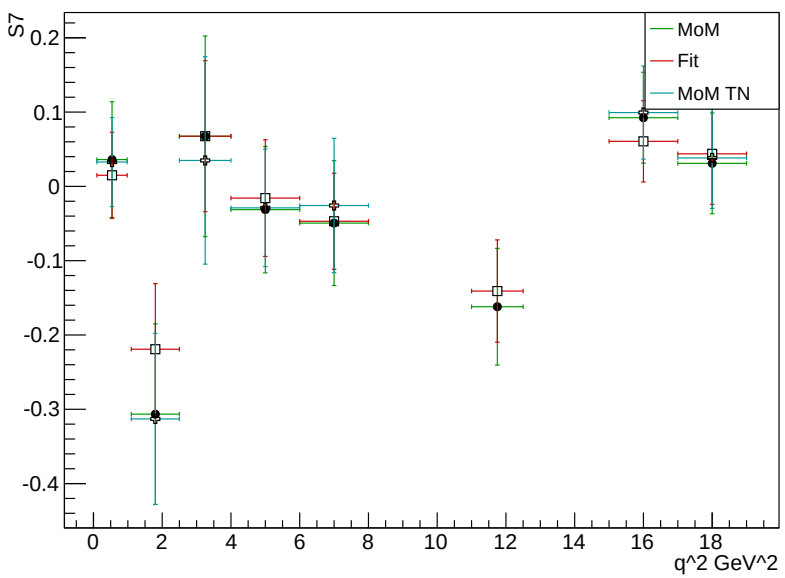


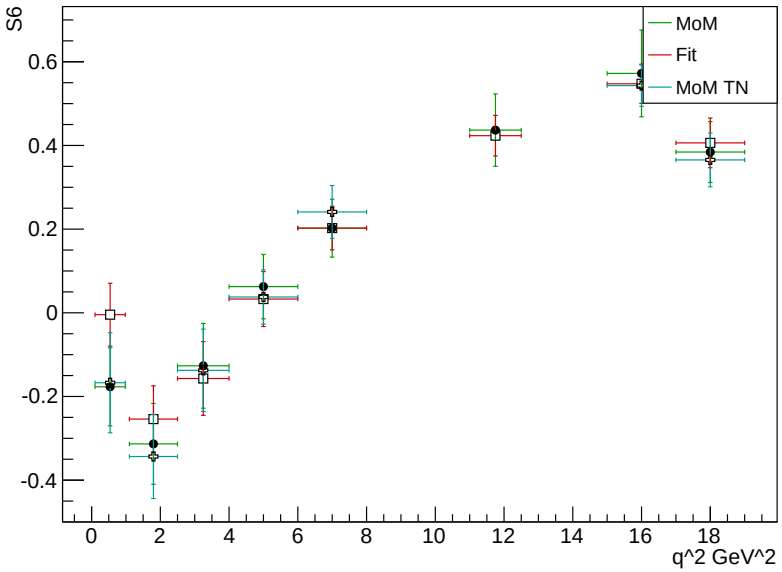


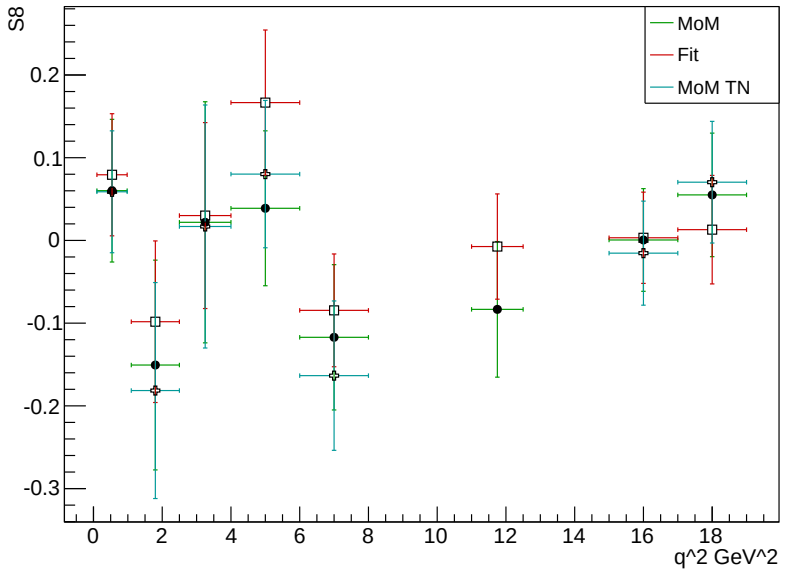
of

Comparison MoM with LL fit









of

Expected differences, MoM vs fit

- We checked this already but as number of sigma is a bit to large for me.
- Let me put once again all the numbers I have in once place.
- Here Signal only, WITH acceptance.

	absolute expected difference at 68% CL							
$q^2[GeV^2/c^4]$	F_l	S_3	S_4	S_5	S_6	S_7	S_8	S_9
0.1 – 0.98	0.035	0.021	0.044	0.028	0.073	0.025	0.038	0.062
1.1 – 2.5	0.062	0.065	0.082	0.061	0.073	0.065	0.084	0.062
2.5 – 4.0	0.062	0.067	0.085	0.077	0.065	0.072	0.080	0.042
4.0 – 6.0	0.043	0.044	0.059	0.056	0.027	0.052	0.054	0.038
6.0 – 8.0	0.038	0.042	0.056	0.053	0.028	0.045	0.051	0.027
15.0 – 17.0	0.027	0.044	0.051	0.042	0.032	0.034	0.045	0.034
17.0 – 19.0	0.034	0.059	0.066	0.055	0.044	0.043	0.056	0.049

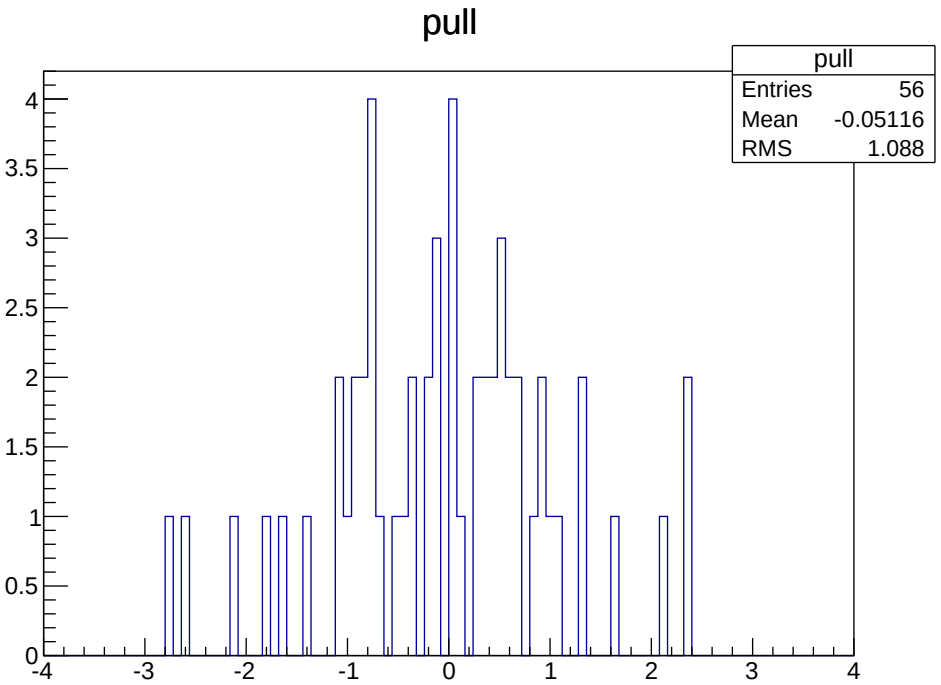
Pull distribution

- Take the observed difference($S_x^{MoM} - S_x^{Fit}$) and divide by the expected difference from table above.



- Important note: The fit I do is weighted, but the pull was obtained using Christoph fit which is unweighed, aka we are comparing apples to oranges here.
- Now repeat the exercise with my own fit weighted fit.

Comparison MoM with LL fit

- My personal opinion: Despite what is expected the left plot scares the hell out of me!
