Overview of recent experimental results in flavour physics

Marcin Chrząszcz mchrzasz@cern.ch

University of Zurich^{uzH}

on behalf of the LHCb collaboration, Universität Zürich,

Institute of Nuclear Physics, Polish Academy of Science

Pittsburgh, 3-6 May 2016

Flavour Physics, WHAT, WHY HOW?

- ⇒ WHAT: Quarks and leptons exists in 6 "flavors" (u,c,t,d,s,b) and (e, μ , τ , ν_e , ν_{μ} , ν_{τ}). ⇒ WHY:
- Flavour is the heart of SM. It involves 22 from 28 free parameters, like masses mixing and CP violation.
- Flavor physics loop processes (box and penguins) are sensitive to energy scales well beyond the ones of the accelerators, thanks to virtual contributions.

\rightarrow Indirect search for New Physics

- \Rightarrow HOW:
- Compare precise theoretical predictions with precise experimental measurements.
- LHCb, Belle, BaBar, ATLAS, CMS, NA62, BESIII, neutrinos experiments,...

Introduction to flavor physics

 \Rightarrow Masses and mixing of quarks have a common origin in the SM: The Yukawa interactions with the Higgs:

$$\mathcal{L}_{\text{Yukawa}} = -Y_{ij}^d \bar{Q'}_{Li} \phi d'_{Rj} - Y_{ij}^u \bar{Q'}_{Ri} \phi u'_{Rj}$$

 \Rightarrow The masses are generated using SSB by diagonalizing Y. The CKM matrix relats the mass eigenstates with the flavour eigenstates:

$$\begin{pmatrix} d \\ s \\ b \end{pmatrix}' = \begin{pmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{tb} \end{pmatrix} \begin{pmatrix} d \\ s \\ b \end{pmatrix}^{\text{phys}}$$

 \Rightarrow The charge current interactions between quarks are proportional to the CKM matrix elements:

$$\mathcal{L}_{CC} = -\frac{g}{\sqrt{2}}\bar{u}\gamma^{\mu}(1-\gamma^5)V_{CKM}d + \dots$$

CP violation

 \Rightarrow The 3×3 CKM has build inside the CP violation:

$$V_{ij} \neq V_{ij}^* \Rightarrow (CP)\mathcal{L}_{CC} \neq \mathcal{L}^{\dagger}$$

 \Rightarrow In the Wolfenstein parametrization the CKM matrix reads:

$$V_{CKM} = \begin{pmatrix} 1 - \lambda^2/2 & \lambda & A\lambda^3(\rho - i\eta) \\ -\lambda & 1 - \lambda^2/2 & A\lambda^2 \\ A\lambda^3(1 - \rho - i\eta) & -A\lambda^2 & 1 \end{pmatrix}$$

Why rare decays?

- In SM allows only the charged interactions to change flavour.
 - Other interactions are flavour conserving.
- One can escape this constrain and produce $b \to s$ and $b \to d$ at loop level.
 - $\circ~$ This kind of processes are suppressed in SM \rightarrow Rare decays.
 - New Physics can enter in the loops.

 W^{\pm}

Searching for New Physics

- \Rightarrow The fundamental questions:
- Why 3 generations? Why such hierarchy structure?
- Stability of the Higgs vacum? Dark Matter?
- Baryon asymmetry of the universe? CP in SM is to small!

Searching for New Physics

- \Rightarrow The fundamental questions:
- Why 3 generations? Why such hierarchy structure?
- Stability of the Higgs vacum? Dark Matter?
- Baryon asymmetry of the universe? CP in SM is to small!
- \Rightarrow Two ways to answer them:
- Direct searches: try to produce directly new real particles "on-shell", but we don't know their mass or lifetime and we are limited by the center-of-mass energy of accelerator.
- Indirect searches: study the effect of "off-shell" (virtual) particles within quantum loop. Compare precise theoretical predictions with precise experimental measurements. Not limited by the center-of-mass energy of accelerator. It happened in the past:
 - $\circ~$ CP violation in the Kaon system: existence of b and t quarks.
 - $\circ~$ Lack of observation of $K^0_S \to \mu \mu$: existence of c quark.
 - $\circ~$ Neutral weak currents: existence of Z boson.
- Very powerful tool!

Selected physics results:

- Rare Decays
 - $\begin{array}{l} \circ \ B^0_s/B^0_d \to \mu\mu \\ \circ \ B^0_d \to K^*\mu\mu, \ B^0_s \to \phi\mu\mu, \ \Lambda_b \to \Lambda\mu\mu. \end{array}$
- Tests of lepton universalities:

$$\circ R_k = \mathcal{B}(B^+ \to K^+ \mu \mu) / \mathcal{B}(B^+ \to K^+ ee)$$

$$\circ R(D), R(D^*)$$

- $(g-2)_{\mu}$
- CP violation:
 - $\circ \gamma$ angle.
 - CP violation in B_d^0 and B_s^0 .
 - CP violation in charm.
 - CP violation in kaons.
 - $\circ V_{ub}.$
- Tetra&Pentaquarks

Heavy flavor experiments

Rare decays

Marcin Chrząszcz (Universität Zürich, IFJ PAN)

Overview of recent experimental results in flavour physics

Tools

• Operator Product Expansion and Effective Field Theory

$$H_{eff} = -\frac{4G_f}{\sqrt{2}}VV'^* \sum_{i} \left[\underbrace{\underbrace{C_i(\mu)O_i(\mu)}_{\text{left-handed}} + \underbrace{C_i'(\mu)O_i'(\mu)}_{\text{right-handed}}\right], \qquad \begin{array}{c} \stackrel{\text{i=1,2}}{\underset{i=3-6,8}{\text{Gluon penguin}}} \\ \stackrel{\text{i=2,6}}{\underset{i=3-6,8}{\text{Gluon penguin}}} \\ \stackrel{\text{i=2,0}}{\underset{i=3-6,8}{\text{Gluon penguin}}} \\ \stackrel{\text{i=3,0}}{\underset{i=3-6,8}{\text{Gluon penguin}}} \\ \stackrel{\text{i=3,0}}{\underset{i=3-6,8}{\text{Gluon$$

where C_i are the Wilson coefficients and O_i are the corresponding effective operators.

 $B^0 o \mu^+ \mu^-$

 Clean theoretical prediction, GIM and helicity suppressed in the SM:

•
$$\mathcal{B}(B^0_s \to \mu^- \mu^+) = (3.65 \pm 0.23) \times 10^{-9}$$

•
$$\mathcal{B}(B^0 \to \mu^- \mu^+) = (1.06 \pm 0.09) \times 10^{-10}$$

- Sensitive to contributions from scalar and pesudoscalar couplings.
- Probing: MSSM, higgs sector, etc.
- In MSSM: ${\cal B}(B^0_s\to\mu^-\mu^+)\sim {\rm tg}^6\,\beta/m_A^4$

$B^0 \rightarrow \mu^+ \mu^-$ searches

 Background rejection power is a key feature of rare decays → use multivariate classifiers (BDT) and strong PID.

• Normalize the BF to $B^+ \to J/\psi(\mu\mu)K^+$ and $B^0 \to K\pi$.

$B^0 \rightarrow \mu^+ \mu^-$ Results

Nov. 2012:

- Measured BF: $\mathcal{B}(B^0_s \to \mu^- \mu^+) = (2.9^{+1.1}_{-1.0}(stat.)^{+0.3}_{-0.1}(syst.)) \times 10^{-9}$
- 4.0σ significance!
- $\mathcal{B}(B^0 \to \mu^- \mu^+) < 7 \times 10^{-10}$ at 95% CL
- CMS result: PRL 111 (2013) 101805

LHCb+CMS Combination

Overview of recent experimental results in flavour physics

Marcin Chrząszcz (Universität Zürich, IFJ PAN)

$B_d^0 \to K^* \mu \mu$

⇒ The decay of $B_d^0 \to K^* \mu \mu$ has number of angular observables that are sensitive to different Wilson coefficients: $C_7^{(\prime)}$, $C_9^{(\prime)}$, $C_{10}^{(\prime)}$. ⇒ The complete angular expression is given by:

$$\frac{1}{\mathrm{d}\Gamma/\mathrm{d}q^2} \frac{\mathrm{d}^4\Gamma}{\mathrm{d}\cos\theta_\ell\,\mathrm{d}\cos\theta_K\,\mathrm{d}\phi\,\mathrm{d}q^2} = \frac{9}{32\pi} \left[\frac{3}{4} (1-F_\mathrm{L}) \sin^2\theta_K + F_\mathrm{L}\cos^2\theta_K + \frac{1}{4} (1-F_\mathrm{L}) \sin^2\theta_K\cos2\theta_\ell \right]$$
$$- F_\mathrm{L}\cos^2\theta_K\cos2\theta_\ell + S_3\sin^2\theta_K\sin^2\theta_\ell\cos2\phi + S_4\sin2\theta_\ell\cos\varphi + S_4\sin2\theta_\ell\cos\varphi + S_5\sin2\theta_K\sin^2\theta_\ell\cos\varphi + S_6\sin^2\theta_K\cos\varphi + S_6\sin^2\theta_K\cos\varphi + S_6\sin^2\theta_K\sin^2\theta_\ell\sin\varphi + S_6\sin^2\theta_K\sin^2\theta_\ell\sin\varphi + S_8\sin^2\theta_K\sin^2\theta_\ell\sin\varphi \right]$$

 \Rightarrow Furthermore, one can construct a form factor free observables:

$$P_5' = \frac{S_5}{F_L(1 - F_L)}$$

- \Rightarrow Analysis performed with 3 methods:
- Likelihood fit.
- Method of moments.
- Amplitudes fit.

Marcin Chrząszcz (Universität Zürich, IFJ PAN)

$B^0_d \rightarrow K^* \mu \mu$ results

arxiv:1604.04042

- Tension with 3 fb⁻¹ gets confirmed!
- two bins both deviate by 2.8σ from SM prediction.
- Result compatible with previous results and Belle!
- SM: JHEP12(2014)125

 $^{18}/_{49}$

$B_d^0 \to K^* \mu \mu$ results

JHEP 02 (2016) 104

 \Rightarrow Method of Moments allowed us to measure for the first time a new observable:

 \Rightarrow LHCb also measured the CP asymmetries with Method of Moments and the likelihood fit that are consistent with SM

Marcin Chrząszcz (Universität Zürich, IFJ PAN)

Compatibility with SM

JHEP 02 (2016) 104

01.0

⇒ Use EOS software package to test compatibility with SM. ⇒ Perform the χ^2 fit to the measured:

$$F_L, A_{FB}, S_{3,...,9}.$$

ズ

 $\Rightarrow \text{Float a vector coupling:} \\ \Re(C_9).$

 \Rightarrow Best fit is found to be 3.4 σ away from the SM.

$$\Delta \Re(C_9) \equiv \Re(C_9)^{\text{III}} - \Re(C_9)^{\text{SM}} = -1.03$$

C.

BF of $B \to K^{*\pm} \mu \mu$

JHEP 07 (2012) 133

Marcin Chrząszcz (Universität Zürich, IFJ PAN)

Overview of recent experimental results in flavour physics

JHEP09 (2015) 179

- Last years LHCb measurement.
- Suppressed by $\frac{f_s}{f_d}$.
- Cleaner because of narrow ϕ resonance.
- 3.3σ deviation in SM in the $1 6 GeV^2$ bin.

JHEP 06 (2015) 115

49

BF of $\Lambda_{\!b} \to \Lambda \mu \mu$

- Last years LHCb measurement.
- In total ~ 300 candidates in data set.
- Decay not present in the low q^2 .

BF of $\Lambda_b \to \Lambda \mu \mu$

- Last years LHCb measurement.
- In total ~ 300 candidates in data set.
- Decay not present in the low q^2 .

Angular analysis of $\Lambda_b \rightarrow \Lambda \mu \mu$

• For the bins in which we have $> 3 \sigma$ significance the forward backward asymmetry for the hadronic and leptonic system.

- A_{FB}^{H} is in good agreement with SM.
- A_{FB}^{ℓ} always in above SM prediction.

JHEP 06 (2015) 115

Lepton Universality tests

Marcin Chrząszcz (Universität Zürich, IFJ PAN)

Overview of recent experimental results in flavour physics

Lepton universality test

- Does the NP couple equally to all flavours? $R_{\rm K} = \frac{\int_{q^2=1}^{q^2=6\,{\rm GeV}^2/c^4} ({\rm d}\mathcal{B}[B^+ \to K^+\mu^+\mu^-]/{\rm d}q^2){\rm d}q^2}{\int_{q^2=1}^{q^2=6\,{\rm GeV}^2/c^4} ({\rm d}\mathcal{B}[B^+ \to K^+e^+e^-]/{\rm d}q^2){\rm d}q^2} = 1 \pm \mathcal{O}(10^{-3}) .$
- Challenging analysis due to bremsstrahlung.
- Migration of events modeled by MC.
- Correct for bremsstrahlung.
- Take double ratio with $B^+ \rightarrow J/\psi K^+$ to cancel systematics.
- In 3fb^{-1} , LHCb measures: $R_K = 0.745^{+0.090}_{-0.074}(stat.)^{+0.036}_{-0.036}(syst.)$
- Consistent with SM at 2.6σ .

More Lepton universality tests

• There is one other LUV decay recently measured by LHCb.

•
$$R(D^*) = \frac{\mathcal{B}(B \to D^* \tau \nu)}{\mathcal{B}(B \to D^* \mu \nu)}$$

- Clean SM prediction: $R(D^*) = 0.252(3)$, PRD 85 094025 (2012)
- • LHCb result: $R(D^*)=0.336\pm 0.027\pm 0.030,$ HFAG average: $R(D^*)=0.322\pm 0.022$
- 4.0σ discrepancy wrt. SM.

Marcin Chrząszcz (Universität Zürich, IFJ PAN)

Overview of recent experimental results in flavour physics

Explanation of anomalies

arXiv:1510.04239

4C

 \Rightarrow Thanks to S. Descotes-Genon, L.Hofer, J.Matias, J.Virto we have a global fit to the anomalies.

⇒ The fit prefer a modification of C_9 Wilson coefficient with a value of $C_9^{NP} = -1$, with a significance over 4σ . ⇒ Many theories link might accommodate the observed deviations.

Explanation of anomalies

- We are not there yet!
- There might be something not taken into account in the theory.
- Resonances ($J\!/\!\psi$, $\psi(2S)$) tails can mimic NP effects.
- There might be some non factorizable QCD corrections. "However, the central value of this effect would have to be significantly larger than expected on the basis of existing estimates" D.Straub, 1503.06199.

 $(g-2)_{\mu}$

Marcin Chrząszcz (Universität Zürich, IFJ PAN)

Overview of recent experimental results in flavour physics

Muon anomalous magnetic moment $(g-2)_{\mu}$

 \Rightarrow Dirac equations predict a muon magnetic moment $\vec{M} = g_{\mu} \frac{e}{2m_{\mu}} \vec{S}$ with a gyromagnetic ratio $g_{\mu} = 2$. Experimentally $g_{\mu} > 2$.

 \Rightarrow This anomaly a_{μ} arises from calculable quantum fluctuations:

 $\Rightarrow \mathsf{SM} \text{ value } a_{\mu}^{\mathrm{SM}} = (116591803 \pm 49) \times 10^{-11} \text{ [PDG 2014]}$ $\Rightarrow \mathsf{Experiment: } a_{\mu}^{\mathrm{E821}} = (116592091 \pm 63) \times 10^{-11} \text{ [PDG 2014]}$ $\Rightarrow \mathsf{Difference: } a_{\mu}^{\mathrm{E821}} - a_{\mu}^{\mathrm{SM}} = (288 \pm 80) \times 10^{-11} \Leftrightarrow 3.6 \ \sigma!$ $\Rightarrow \mathsf{Underestimated uncertainties? \mathsf{SUSY? NP?} }$ $\Rightarrow \mathsf{Fermilabs E989 should futher reduce the experimental error to } \pm 16 \times 10^{-11}.$

γ angle

$$\Rightarrow \gamma = \arg\left(-\frac{V_{ud}V_{ub}^*}{V_{cd}V_{cb}^*}\right) \approx \arg\left(-\frac{V_{ub}^*}{V_{cb}^*}\right) \text{ is the last well known CKM angles.}$$

- \Rightarrow Can be determined by:
- Tree level processes, nearly insensitive to NP. Act as reference. Negligible theoretical uncertainty, using B → DK.
- Loop processes, sensitive to NP.
- ⇒ Comparing the two can reveal NP!

- \Rightarrow The LHCb combinations leads to: $\gamma = 70.9^{+7.1}_{-8.5}$.
- \Rightarrow Improved by $2^{\rm deg}$ compared to our previous result!
- ⇒ Other B-factories have 2 times larger errors:
- BaBar: $\gamma = (70 \pm 18)^{deg}$
- Belle: $\gamma = (73^{+18}_{-15})^{\text{deg}}$

Marcin Chrząszcz (Universität Zürich, IFJ PAN)

Mixing induced CPV in B_s^0

 \Rightarrow Interference between B^0_s decaying to $J/\psi\phi$ either directly or by oscillations gives rise to CP violation phase: $\phi_s^{J/\psi\phi}$

 $\begin{array}{l} \Rightarrow \text{ In the Sm } \phi_s \approx -2\beta + s = -(0.0376^{+0.0007}_{-0.0008}) \text{ rad, where } \beta_s = \\ \arg\left(-\frac{V_{ts}V^*_{tb}}{V_{cs}V^*_{cb}}\right) \\ \Rightarrow \text{ At the leading order the same phase is expected } B^0_s \rightarrow D_s D_s \text{ and} \end{array}$

 $B \to J/\psi \pi \pi$.

 \Rightarrow NP can enter in the B_s^0 mixing!

 \Rightarrow Measured by simultaneous fit to B_s^0 and $\overline{B_s^0}$ decay rates:

 $\frac{\mathrm{d}^{4}\Gamma(B_{s}^{0}\rightarrow J/\psi\phi)}{\mathrm{d}t\,\mathrm{d}\cos\theta_{\mu}\,\mathrm{d}\varphi_{h}\,\mathrm{d}\cos\theta_{K}}=f(\phi_{s},\Delta\Gamma_{s},\Gamma_{s},\Delta m_{s},M(B_{s}^{0}),|A_{\perp}|,|A_{\parallel}|,|A_{S}|,\delta_{\perp},\delta_{\parallel},\ldots)$

Mixing induced CPV in B_s^0

 \Rightarrow Unbinned maximum likelihood fit (time, mass, angles, initial flavour):

- $\phi_s = -0.058 \pm 0.049 \pm 0.006$ rad.
- $\Gamma_s = (\Gamma_L + \Gamma_H)/2 = 0.6603 \pm 0.0027 \pm 0.0015 \text{ ps}^{-1}$
- $\Delta\Gamma_s = \Gamma_L \Gamma_H = 0.0805 \pm 0.0091 \pm 0.0032 \text{ ps}^{-1}$
- Combined with $B_s^0 \rightarrow J/\psi \pi \pi$: $\phi_s = -0.010 \pm 0.039$ rad.

Marcin Chrząszcz (Universität Zürich, IFJ PAN)

Mixing induced CPV in B_s^0

 \Rightarrow LHCb is dominating the world average!

 $\Rightarrow \phi_s^{\text{HFAG}} = -0.034 \pm 0.033.$

- \Rightarrow Compatible with SM, but there is still plenty room for NP!
- \Rightarrow Penguin pollution constrained from $B^0 \to J/\psi \rho$ and $B^0_s \to J/\psi \bar{K^*}$

Nature Physics 11, 743-747 (2015)

 \Rightarrow Since a long time the smallest of the CKM matrix elements V_{ub} has been determined in two ways:

- inclusively: $b \to u\ell\nu$, $|V_{ub}| = (4.41 \pm 0.15^{+0.15}_{-0.17}) \times 10^{-3}$
- exclusively: $B \to \pi \ell \nu$, $|V_{ub}| = (3.28 \pm 0.29) \times 10^{-3}$
- 3 σ tensions!

 V_{ub}

 \Rightarrow LHCb perspectively enters the game with baryons decay: $\Lambda_b \rightarrow p \mu \nu$.

where R_{FF} is a ratio of form factors, that can be calculated using lattice QCD [rxiv:1503.01421].

Marcin Chrząszcz (Universität Zürich, IFJ PAN)

Overview of recent experimental results in flavour physics

Nature Physics 11, 743-747 (2015)

$\Rightarrow |V_{ub}| = (3.27 \pm 0.15 \pm 0.16 \pm 0.06(V_{cb})) \times 10^{-3}$

- LHCbs measurement makes the discrepancy larger and is spot on the Exclusive B-factories results.
- Disfavor NP models with significant right handed current
- Debatable world averages, depending on the input used (theory, BR of control mode, ...)

CP violation in charm

LHCb-PAPER-2015-055, PLB 753 (2016) 412

 \Rightarrow The A_{CP} asymmetry is defined as:

$$A_{CP}(D^{0} \to f) = \frac{\Gamma(D^{0} \to f) - \Gamma(\bar{D^{0}} \to f)}{\Gamma(D^{0} \to f) + \Gamma(\bar{D^{0}} \to f)}, \quad f = K^{+}K^{-}, \pi^{+}\pi^{-}$$

⇒ New world average:

 $a_{CP}^{\text{ind}} = (0.056 \pm 0.040)\%$ $a_{CP}^{\text{dir}} = (-0.137 \pm 0.070)\%$

 \Rightarrow Results consistent with no CPV at 6.5~% CL.

Marcin Chrząszcz (Universität Zürich, IFJ PAN)

Overview of recent experimental results in flavour physics

49

Direct CPV in kaons

 \Rightarrow 1999: Discovery of CP violation in $K \rightarrow \pi\pi$ (NA48, KTeV).

⇒ 2001: Combined experimental average of the two above experiments: $\Re(\epsilon'/\epsilon) = (16.6 \pm 2.3)$ %, compatible with SM. Experimental precision much better than the theoretical prediction.

 \Rightarrow 2015: Fantastic progresses in lattice QCD. Can now compute all relevant long-distance effects that used to dominate the theoretical uncertainty:

 $\Re(\epsilon'/\epsilon) = (1.9 \pm 4.5) \times 10^{-4}$

 \Rightarrow A brand new 2.9 σ tension arrives!

 \Rightarrow A.Buras, et.al. [JHEP03(2016)010] This discrepancy can be linked to aforementioned $b \rightarrow s\ell\ell$ anomalies.

 \Rightarrow Good lattice prospects to improve even further the theoretical uncertainty

Global CKM fit

http://ckmfitter.in2p3.fr

 \Rightarrow Excellent consistency of the various CKM measurements so far!

Tetra&Petraquarks

Tetra&Petraquarks

PHYSICS LETTERS

1 February 1964

A SCHEMATIC MODEL OF BARYONS AND MESONS *

M. GELL-MANN California Institute of Technology, Pasadena, California

Received 4 January 1964

If we assume that the strong interactions of baryons and mesons are correctly described in terms of the broken "eightfold way" 1-3), we are tempted to look for some fundamental explanation of the situation. A highly promised approach is the purely dynamical "bootstrap" model for all the strongly interacting particles within which one may try to derive isotopic spin and strangeness conservation and broken eightfold symmetry from self-consistency alone 4). Of course, with only strong interactions. the orientation of the asymmetry in the unitary space cannot be specified; one hopes that in some way the selection of specific components of the Fspin by electromagnetism and the weak interactions determines the choice of isotopic spin and hypercharge directions.

ber $n_{\ell} - n_{\tilde{t}}$ would be zero for all known baryons and mesons. The most interesting example of such a model is one in which the triplet has spin $\frac{1}{2}$ and z = -1, so that the four particles d^- , s^- , u^0 and b^0 exhibit a parallel with the leptons.

A simpler and more elegant scheme can be constructed if we allow non-integral values for the charges. We can dispense entirely with the basic baryon b if we assign to the triplet the following properties: spin $\frac{1}{2}$, $z = -\frac{1}{2}$, and baryon number $\frac{1}{2}$, we then refer to the mombers u_1 , d^{-1} , and z^{-1} of u^{-1} we then refer to the mombers u_1 , d^{-1} , and z^{-1} of the then refer to the mombers u_1 , d^{-1} , and z^{-1} of the then refer to the mombers u_1 , d^{-1} , and z^{-1} of the then refer to the mombers u_1 , d^{-1} , u_2 , d^{-1} , and z^{-1} of u_1 , u_2 , u_3 , u_4 , u_1 , u_2 , u_3 , u_4 , u_4 , u_5 , u_6 , u_1 , u_2 , u_3 , u_4 , u_4 , u_4 , u_4 , u_4 , u_5 , u_6

⇒ Searches for years and many "discoveries" not confirmed

Marcin Chrząszcz (Universität Zürich, IFJ PAN)

X(3872)

 \Rightarrow First observed by Belle in $B^+ \rightarrow X(J/\psi \pi \pi)K^+$, above the $\Upsilon(2S)$. [PRL 91 (2003) 262001]

 \Rightarrow Confirmed by several experiments: BaBar, CDF, D0, LHCb, CMS.

⇒ LHCb determined its quantum numbers: $J^{PC} = 1^{++}$ using angular analysis [PRL 110, 222001 (2013)].

 \Rightarrow The nature of this state is still unclear. It is compatible with a tetraquark, DD^* molecule or a $\chi_{c1}(2^3P_1)$ hypothesis.

 \Rightarrow Never LHCb measurements disfavour the DD^* molecule by $4.4~\sigma$ [Nucl. Phys. B886 (2014) 665].

$Z(4430)^{-}$

 $\Rightarrow Z(4430)^-$ special "tetraquark candidate",because charged: cannot be a $c\bar{c}$ state!

⇒ Belle discovered it in $B^0 \rightarrow \Upsilon(2S)K\pi$, with evidence of $J^P = 1^+$ [PRD 88 (2013) 074026]. ⇒ Using method of moments, Babar claimed they do not need the $Z(4430)^-$ to described their data [PRD 79 (2009) 112001].

 \Rightarrow LHCb reproduced BaBar moments analysis with the full Run1 sample (3 $\rm fb^{-1}$) and clearly something mote was needed to describe the data [PRL 112, 222002 (2014)].

$Z(4430)^{-}$

LHCb, PRL 112, 222002 (2014)

⇒ LHCb unbinned amplitude analysis of $B^0 \rightarrow \psi(2S)K^+\pi^-$, $m = 4475 \pm 7^{+15}_{-25} \text{ MeV/c}^2$, $\Gamma = 172 \pm 13^{37}_{34} \text{ MeV/c}^2$ $\rightarrow I^P$ is confirmed to be 1[±] and Arcord relationships the trained

 $\Rightarrow J^P$ is confirmed to be 1^+ and Argand plot shows the typical pattern for resonances.

 \Rightarrow Minimal quark content $c\overline{c}d\overline{u}$.

⁴/49

Pentaquarks in $\Lambda_b \rightarrow J/\psi p K$

[LHCb, PRL 115 (2015) 072001]

- $\Rightarrow \Lambda_b \to J/\psi p K$ was studied initially for a precise Λ_b lifetime .
- \Rightarrow Close look at the Dalitz: $m(Kp) m(J/\psi p)$
- m(Kp) has a rich structure of excited Λ states.
- $m(J/\psi p)$ has something inside!

Pentaquarks in $\Lambda_b \rightarrow J/\psi p K$

[LHCЬ, PRL 115 (2015) 072001]

 \Rightarrow Super complex fit needed to describe the data: 5 decay angles, 14 possible Λ^* resonances for $m(K\pi)$ and two brand new pentaquarks for $m(J/\psi p)$:

- $P_c(4380)^+: 4380 \pm 8 \pm 29 \text{ MeV/c}^2$, $\Gamma = 205 \pm 18 \pm 86 \text{ MeV/c}^2$, $J^P = \frac{3}{2}^-$
- $P_c(4450)^+: 4449, 8 \pm 1.7 \pm 2.5 \text{ MeV/c}^2$, $\Gamma = 39 \pm 5 \pm 19 \text{ MeV/c}^2$, $J^P = \frac{5}{2}^+$

Pentaquarks in $\Lambda_b \rightarrow J/\psi p K$

- Angrad plots show the phase motion for the resonances.
- The $P_c(4380)$ has one point off by a 2σ .

 $\begin{array}{c} 0.15 \\ \hline \\ 0.05$

The interference patterns confirm the opposite parities.

- \Rightarrow The significance was evaluated with a TOY MC:
- $P_c(4380)^+: 9\sigma$
- $P_c(4450)^+$: 12σ
- \Rightarrow The states are consistent with $c\overline{c}uud$.

[LHCb, PRL 115 (2015) 072001]

Conclusions

⇒ Flavour physics is still playing an important role for hunting new physics! ⇒ Anomalies in the electroweak penguin and lepton universality combine to over 4σ significance discrepancy for NP.

 \Rightarrow The dominant anomaly was recently confirmed by Belle experiment.

 $\Rightarrow \gamma$ angle combination from LHCb is now two times more precise then the B-factories.

 \Rightarrow After 50 years after the first prof. Gelman paper the pentraquark states have been observed.

 \Rightarrow Stay tuned as there are plenty of more results in the pipe line!

Thank you for the attention!

Marcin Chrząszcz (Universität Zürich, IFJ PAN)

If not NP?

- How about our clean P_i observables?
- The QCD cancel as mentioned only at leading order.
- Comparison to normal observables with the optimised ones.

Transversity amplitudes

 \Rightarrow One can link the angular observables to transversity amplitudes

$$\begin{split} J_{1s} &= \frac{(2+\beta_{\ell}^2)}{4} \left[|A_{\perp}^L|^2 + |A_{\parallel}^R|^2 + |A_{\perp}^R|^2 + |A_{\parallel}^R|^2 \right] + \frac{4m_{\ell}^2}{q^2} \operatorname{Re} \left(A_{\perp}^L A_{\perp}^{R*} + A_{\parallel}^L A_{\parallel}^{R*} \right) , \\ J_{1c} &= |A_0^L|^2 + |A_0^R|^2 + \frac{4m_{\ell}^2}{q^2} \left[|A_t|^2 + 2\operatorname{Re}(A_0^L A_0^{R*}) \right] + \beta_{\ell}^2 |A_S|^2 , \\ J_{2s} &= \frac{\beta_{\ell}^2}{4} \left[|A_{\perp}^L|^2 + |A_{\parallel}^R|^2 + |A_{\perp}^R|^2 + |A_{\parallel}^R|^2 \right] , \qquad J_{2c} = -\beta_{\ell}^2 \left[|A_0^L|^2 + |A_0^R|^2 \right] , \\ J_3 &= \frac{1}{2} \beta_{\ell}^2 \left[|A_{\perp}^L|^2 - |A_{\parallel}^L|^2 + |A_{\perp}^R|^2 - |A_{\parallel}^R|^2 \right] , \qquad J_4 = \frac{1}{\sqrt{2}} \beta_{\ell}^2 \left[\operatorname{Re}(A_0^L A_{\parallel}^{L*} + A_0^R A_{\parallel}^{R*}) \right] , \\ J_5 &= \sqrt{2} \beta_{\ell} \left[\operatorname{Re}(A_0^L A_{\perp}^{L*} - A_0^R A_{\perp}^{R*}) - \frac{m_{\ell}}{\sqrt{q^2}} \operatorname{Re}(A_{\parallel}^L A_{S}^* + A_{\parallel}^{R*} A_S) \right] , \\ J_{6s} &= 2\beta_{\ell} \left[\operatorname{Re}(A_{\parallel}^L A_{\perp}^{L*} - A_{\parallel}^R A_{\perp}^{R*}) \right] , \qquad J_{6c} = 4\beta_{\ell} \frac{m_{\ell}}{\sqrt{q^2}} \operatorname{Re}(A_0^L A_{S}^* + A_0^{R*} A_S) \end{split}$$

$$J_7 \quad = \quad \sqrt{2}\beta_\ell \left[\mathrm{Im}(\mathbf{A}_0^{\mathrm{L}}\mathbf{A}_{\parallel}^{\mathrm{L}*} - \mathbf{A}_0^{\mathrm{R}}\mathbf{A}_{\parallel}^{\mathrm{R}*}) + \frac{\mathbf{m}_\ell}{\sqrt{\mathsf{q}^2}} \, \mathrm{Im}(\mathbf{A}_{\perp}^{\mathrm{L}}\mathbf{A}_{\mathrm{S}}^* - \mathbf{A}_{\perp}^{\mathrm{R}*}\mathbf{A}_{\mathrm{S}})) \right],$$

 $J_8 = \frac{1}{\sqrt{2}} \beta_\ell^2 \left[\operatorname{Im}(\mathbf{A}_0^{\mathbf{L}} \mathbf{A}_\perp^{\mathbf{L}} + \mathbf{A}_0^{\mathbf{R}} \mathbf{A}_\perp^{\mathbf{R}}) \right] , \qquad \qquad J_9 = \beta_\ell^2 \left[\operatorname{Im}(\mathbf{A}_\parallel^{\mathbf{L}*} \mathbf{A}_\perp^{\mathbf{L}} + \mathbf{A}_\parallel^{\mathbf{R}*} \mathbf{A}_\perp^{\mathbf{R}}) \right] ,$

Link to effective operators

 \Rightarrow So here is where the magic happens. At leading order the amplitudes can be written as (soft form factors):

$$A_{\perp}^{L,R} = \sqrt{2}Nm_{B}(1-\hat{s}) \bigg[(\mathcal{C}_{9}^{\rm eff} + \mathcal{C}_{9}^{\rm eff'}) \mp (\mathcal{C}_{10} + \mathcal{C}_{10}') + \frac{2\hat{m}_{b}}{\hat{s}} (\mathcal{C}_{7}^{\rm eff} + \mathcal{C}_{7}^{\rm eff'}) \bigg] \xi_{\perp}(E_{K^{*}})$$

$$A_{\parallel}^{L,R} \quad = \quad -\sqrt{2}Nm_B(1-\hat{s})\left[(\mathcal{C}_9^{\mathrm{eff}} - \mathcal{C}_9^{\mathrm{eff}}) \mp (\mathcal{C}_{10} - \mathcal{C}_{10}') + \frac{2\hat{m}_b}{\hat{s}} (\mathcal{C}_7^{\mathrm{eff}} - \mathcal{C}_7^{\mathrm{eff}}) \right] \xi_{\perp}(E_{K^*})$$

$$A_0^{L,R} = -\frac{Nm_B(1-\hat{s})^2}{2\hat{m}_{K^*}\sqrt{\hat{s}}} \left[(\mathcal{C}_9^{\rm eff} - \mathcal{C}_9^{\rm eff\prime}) \mp (\mathcal{C}_{10} - \mathcal{C}_{10}') + 2\hat{m}_b(\mathcal{C}_7^{\rm eff} - \mathcal{C}_7^{\rm eff\prime}) \right] \xi_{\parallel}(E_{K^*}),$$

where $\hat{s}=q^2/m_B^2$, $\hat{m}_i=m_i/m_B$. The $\xi_{\parallel,\perp}$ are the form factors.

Link to effective operators

 \Rightarrow So here is where the magic happens. At leading order the amplitudes can be written as (soft form factors):

$$A_{\perp}^{L,R} = \sqrt{2} N m_B (1-\hat{s}) \left[(\mathcal{C}_9^{\text{eff}} + \mathcal{C}_9^{\text{eff}}) \mp (\mathcal{C}_{10} + \mathcal{C}_{10}') + \frac{2\hat{m}_b}{\hat{s}} (\mathcal{C}_7^{\text{eff}} + \mathcal{C}_7^{\text{eff}}) \right] \xi_{\perp}(E_{K^*})$$

$$A_{\parallel}^{L,R} = -\sqrt{2}Nm_B(1-\hat{s})\left[(\mathcal{C}_9^{\text{eff}} - \mathcal{C}_9^{\text{eff}}) \mp (\mathcal{C}_{10} - \mathcal{C}_{10}') + \frac{2\hat{m}_b}{\hat{s}}(\mathcal{C}_7^{\text{eff}} - \mathcal{C}_7^{\text{eff}}) \right] \xi_{\perp}(E_{K^*})$$

$$A_0^{L,R} = -\frac{Nm_B(1-\hat{s})^2}{2\hat{m}_{K^*}\sqrt{\hat{s}}} \left[(\mathcal{C}_9^{\rm eff} - \mathcal{C}_9^{\rm eff}) \mp (\mathcal{C}_{10} - \mathcal{C}'_{10}) + 2\hat{m}_b (\mathcal{C}_7^{\rm eff} - \mathcal{C}_7^{\rm eff}) \right] \xi_{\parallel}(E_{K^*}),$$

where $\hat{s} = q^2/m_B^2$, $\hat{m}_i = m_i/m_B$. The $\xi_{\parallel,\perp}$ are the form factors. \Rightarrow Now we can construct observables that cancel the ξ form factors at leading order:

$$P_5' = \frac{J_5 + J_5}{2\sqrt{-(J_2^c + \bar{J}_2^c)(J_2^s + \bar{J}_2^s)}}$$

Mass modelling

⇒ The signal is modelled by a sum of two Crystal-Ball functions with common mean. ⇒ The background is a single exponential. ⇒ The base parameters are obtained from the proxy channel: $B_d^0 \rightarrow J/\psi(\mu\mu)K^*$. ⇒ All the parameters are fixed in the signal pdf.

 \Rightarrow Scaling factors for resolution are determined from MC.

 \Rightarrow In fitting the rare mode only the signal, background yield and the slope of the exponential is left floating.

 \Rightarrow We found 624 ± 30 candidates in the

most interesting $[1.1, 6.0] \text{ GeV}^2/c^4$ region \Rightarrow The S-wave fraction is extracted using a and 2398 ± 57 in the full range LASS model. [1.1, 19.] GeV^2/c^4 .

Detector acceptance

- Detector distorts our angular distribution.
- We need to model this effect.
- 4D function is used:

 $\epsilon(\cos\theta_l,\cos\theta_k,\phi,q^2) = \sum_{ijkl} P_i(\cos\theta_l) P_j(\cos\theta_k) P_k(\phi) P_l(q^2),$

where P_i is the Legendre polynomial of order i.

- We use up to $4^{th}, 5^{th}, 6^{th}, 5^{th}$ order for the $\cos \theta_l, \cos \theta_k, \phi, q^2$.
- The coefficients were determined using Method of Moments, with a huge simulation sample.
- The simulation was done assuming a flat phase space and reweighing the q² distribution to make is flat.

Control channel

- We tested our unfolding procedure on $B \rightarrow J/\psi K^*$.
- The result is in perfect agreement with other experiments and our different analysis of this decay.

The columns of New Physics

Marcin Chrząszcz (Universität Zürich, IFJ PAN)

Overview of recent experimental results in flavour physics

$B_d^0 \to K^* \mu \mu$ results

 \Rightarrow In the maximum likelihood fit one could weight the events accordingly to the 1

 $\overline{\varepsilon(\cos\theta_l,\cos\theta_k,\phi,q^2)}$

 \Rightarrow Better alternative is to put the efficiency into the maximum likelihood fit itself:

$$\mathcal{L} = \prod_{i=1}^{N} \epsilon_i(\Omega_i, q_i^2) \mathcal{P}(\Omega_i, q_i^2) / \int \epsilon(\Omega, q^2) \mathcal{P}(\Omega, q^2) d\Omega dq^2$$

 \Rightarrow Only the relative weights matters!

 \Rightarrow The Procedure was commissioned with TOY MC study.

 \Rightarrow Use Feldmann-Cousins to determine the uncertainties.

 \Rightarrow Angular background component is modelled with 2^{nd} order Chebyshev polynomials, which was tested on the side-bands.

 \Rightarrow S-wave component treated as nuisance parameter.

Maximum likelihood fit - Results

Marcin Chrząszcz (Universität Zürich, IFJ PAN)

Overview of recent experimental results in flavour physics

Method of moments

 \Rightarrow See Phys.Rev.D91(2015)114012, F.Beaujean , M.Chrzaszcz, N.Serra, D. van Dyk for details.

 \Rightarrow The idea behind Method of Moments is simple: Use orthogonality of spherical harmonics, $f_j(\overrightarrow{\Omega})$ to solve for coefficients within a q^2 bin:

$$\int f_i(\overrightarrow{\Omega}) f_j(\overrightarrow{\Omega}) = \delta_{ij}$$

$$M_i = \int \left(\frac{1}{d(\Gamma + \bar{\Gamma})/dq^2}\right) \frac{d^3(\Gamma + \bar{\Gamma})}{d\overrightarrow{\Omega}} f_i(\overrightarrow{\Omega}) d\Omega$$

 \Rightarrow Don't have true angular distribution but we "sample" it with our data. \Rightarrow Therefore: $\int \rightarrow \sum$ and $M_i \rightarrow \widehat{M}_i$

$$\hat{M}_i = \frac{1}{\sum_e \omega_e} \sum_e \omega_e f_i(\overrightarrow{\Omega}_e)$$

 \Rightarrow The weight ω accounts for the efficiency. Again the normalization of weights does not matter.

Amplitudes method

⇒ Fit for amplitudes as (continuous) functions of q^2 in the region: $q^2 \in [1.1.6.0] \text{ GeV}^2/\text{c}^4$. ⇒ Needs some Ansatz:

$$A(q^2) = \alpha + \beta q^2 + \frac{\gamma}{q^2}$$

 \Rightarrow The assumption is tested extensively with toys.

- \Rightarrow Set of 3 complex parameters α, β, γ per vector amplitude:
- L, R, 0, \parallel , \perp , \Re , $\Im \rightarrow 3 \times 2 \times 3 \times 2 = 36$ DoF.
- Scalar amplitudes: +4 DoF.
- Symmetries of the amplitudes reduces the total budget to: 28.
- ⇒ The technique is described in JHEP06(2015)084, U. Egede, M. Patel, K.A. Petridis.
- \Rightarrow Allows to build the observables as continuous functions of q^2 :
- At current point the method is limited by statistics.
- In the future the power of this method will increase.

 \Rightarrow Allows to measure the zero-crossing points for free and with smaller errors than previous methods.

Amplitudes - results

Zero crossing points:

$q_0(S_4) < 2.65$	at 95% CL
$q_0(S_5) \in [2.49, 3.95]$	at $68\%\ CL$
$q_0(A_{FB}) \in [3.40, 4.87]$	at 68% CL
