Korean Physics Society Meeting,  
19 April 2017

# Why electroweak penguin decays?

- In the SM allows only the charged interactions to change flavour.
  - Other interactions are flavour conserving.
- One can escape this constrain and produce  $b \rightarrow s$  and  $b \rightarrow d$  at loop level.
  - This kind of processes are suppressed in the SM  $\rightarrow$  Rare decays.
  - New Physics can enter in the loops.

## • Operator Product Expansion and Effective Field Theory

$$H_{eff} = -\frac{4G_f}{\sqrt{2}} VV'^* \sum_i \left[ \underbrace{C_i(\mu) O_i(\mu)}_{\text{left-handed}} + \underbrace{C'_i(\mu) O'_i(\mu)}_{\text{right-handed}} \right],$$

- i=1,2 Tree
- i=3-6,8 Gluon penguin
- i=7 Photon penguin
- i=9,10 EW penguin
- i=S Scalar penguin
- i=P Pseudoscalar penguin

where  $C_i$  are the Wilson coefficients and  $O_i$  are the corresponding effective operators.

- Excellent Impact Parameter (IP) resolution ( $20 \mu\text{m}$ ).  
 $\Rightarrow$  Identify secondary vertices from heavy flavour decays
- Proper time resolution  $\sim 40 - 50 \text{ fs}$ .  
 $\Rightarrow$  Good separation of primary and secondary vertices.
- Excellent momentum ( $\delta p/p \sim 0.5 - 1.0\%$ ) and inv. mass resolution.  
 $\Rightarrow$  Low combinatorial background.

- Excellent Muon identification  $\epsilon_{\mu \rightarrow \mu} \sim 97\%$ ,  $\epsilon_{\pi \rightarrow \mu} \sim 1 - 3\%$
- Good  $K - \pi$  separation via RICH detectors,  $\epsilon_{K \rightarrow K} \sim 95\%$ ,  
 $\epsilon_{\pi \rightarrow K} \sim 5\%$ .  
 $\Rightarrow$  Reject peaking backgrounds.
- High trigger efficiencies, low momentum thresholds.  
 $B \rightarrow J/\psi X$ : Trigger  $\sim 90\%$ .

# Recent measurements of $b \rightarrow sll$

$\Rightarrow$  Branching fractions:

$$B \rightarrow K\mu^- \mu^+ \quad 1606.04731$$

$$B_s^0 \rightarrow \phi\mu^- \mu^+ \quad \text{JHEP 09 (2015) 179}$$

$$B^\pm \rightarrow \pi^\pm \mu^- \mu^+ \quad \text{JHEP 12 (2012) 125}$$

$$\Lambda_b \rightarrow \Lambda\mu^- \mu^+ \quad \text{JHEP 06 (2015) 115}$$

$$B \rightarrow \mu^- \mu^+ \quad \text{Nature 15}$$

$\Rightarrow$  CP asymmetry:

$$B^\pm \rightarrow \pi^\pm \mu^- \mu^+ \quad \text{JHEP 10 (2015) 034}$$

$\Rightarrow$  Isospin asymmetry:

$$B \rightarrow K\mu^- \mu^+ \quad \text{JHEP 06 (2014) 133}$$

$\Rightarrow$  Lepton Universality:

$$B^\pm \rightarrow K^\pm \ell \bar{\ell} \quad \text{PRL 113, (2014)}$$

$\Rightarrow$  Angular:

$$B^0 \rightarrow K^* \ell \bar{\ell} \quad \text{JHEP 02 (2016) 104}$$

$$B^{0,\pm} \rightarrow K^{*,\pm} \ell \bar{\ell} \quad \text{PRD 86 032012}$$

$$B_s^0 \rightarrow \phi \mu \mu \quad \text{JHEP 09 (2015) 179}$$

$$\Lambda_b \rightarrow \Lambda \mu^- \mu^+ \quad \text{JHEP 06 (2015) 115}$$

# Recent measurements of $b \rightarrow sll$

⇒ Branching fractions:

$$B \rightarrow K\mu^- \mu^+ \quad 1606.04731$$

$$B_s^0 \rightarrow \phi\mu^- \mu^+ \quad \text{JHEP 09 (2015) 179}$$

$$B^\pm \rightarrow \pi^\pm \mu^- \mu^+ \quad \text{JHEP 12 (2012) 125}$$

$$\Lambda_b \rightarrow \Lambda\mu^- \mu^+ \quad \text{JHEP 06 (2015) 115}$$

$$B \rightarrow \mu^- \mu^+ \quad \text{Nature 15}$$

⇒ CP asymmetry:

$$B^\pm \rightarrow \pi^\pm \mu^- \mu^+ \quad \text{JHEP 10 (2015) 034}$$

⇒ Isospin asymmetry:

$$B \rightarrow K\mu^- \mu^+ \quad \text{JHEP 06 (2014) 133}$$

⇒ Lepton Universality:

$$B^\pm \rightarrow K^\pm l\bar{l} \quad \text{PRL 113, (2014)}$$

⇒ Angular:

$$B^0 \rightarrow K^* l\bar{l} \quad \text{PRD 86 032012}$$

$$B^{0,\pm} \rightarrow K^{*,\pm} l\bar{l} \quad \text{JHEP 09 (2015) 179}$$

$$B_s^0 \rightarrow \phi l\bar{l} \quad \text{JHEP 09 (2015) 179}$$

$$\Lambda_b \rightarrow \Lambda\mu^- \mu^+ \quad \text{JHEP 06 (2015) 115}$$

> 2  $\sigma$  deviations from the SM

⇒ This talk is not possible to cover all flavour anomalies.

## Observables in $B \rightarrow K^* \mu \mu$

⇒ The kinematics of  $B^0 \rightarrow K^* \mu^- \mu^+$  decay is described by three angles  $\theta_l$ ,  $\theta_k$ ,  $\phi$  and invariant mass of the dimuon system ( $q^2$ ).

⇒ The angular distribution can be written as:

$$\frac{1}{d(\Gamma + \bar{\Gamma})/dq^2} \frac{d(\Gamma + \bar{\Gamma})}{d\cos\theta_l d\cos\theta_k d\phi} \Big|_P = \frac{9}{32\pi} \left[ \frac{3}{4}(1 - F_L) \sin^2 \theta_k \right. \\ + F_L \cos^2 \theta_k + \frac{1}{4}(1 - F_L) \sin^2 \theta_k \cos 2\theta_l \\ - F_L \cos^2 \theta_k \cos 2\theta_l + S_3 \sin^2 \theta_k \sin^2 \theta_l \cos 2\phi \\ + S_4 \sin 2\theta_k \sin 2\theta_l \cos \phi + S_5 \sin 2\theta_k \sin \theta_l \cos \phi \\ + \frac{4}{3} A_{FB} \sin^2 \theta_k \cos \theta_l + S_7 \sin 2\theta_k \sin \theta_l \sin \phi \\ \left. + S_8 \sin 2\theta_k \sin 2\theta_l \sin \phi + S_9 \sin^2 \theta_k \sin^2 \theta_l \sin 2\phi \right].$$

⇒ This equation is valid in the SM for massless leptons!

## Link to effective operators

⇒ The observables  $S_i$  are bilinear combinations of transversity amplitudes:  $A_{\perp}^{L,R}$ ,  $A_{\parallel}^{L,R}$ ,  $A_0^{L,R}$ .

⇒ So here is where the magic happens. At leading order the amplitudes can be written as:

$$A_{\perp}^{L,R} = \sqrt{2}Nm_B(1 - \hat{s}) \left[ (C_9^{\text{eff}} + C_9^{\text{eff}'}) \mp (C_{10} + C'_{10}) + \frac{2\hat{m}_b}{\hat{s}}(C_7^{\text{eff}} + C_7^{\text{eff}'}) \right] \xi_{\perp}(E_{K^*})$$

$$A_{\parallel}^{L,R} = -\sqrt{2}Nm_B(1 - \hat{s}) \left[ (C_9^{\text{eff}} - C_9^{\text{eff}'}) \mp (C_{10} - C'_{10}) + \frac{2\hat{m}_b}{\hat{s}}(C_7^{\text{eff}} - C_7^{\text{eff}'}) \right] \xi_{\perp}(E_{K^*})$$

$$A_0^{L,R} = -\frac{Nm_B(1 - \hat{s})^2}{2\hat{m}_{K^*}\sqrt{\hat{s}}} \left[ (C_9^{\text{eff}} - C_9^{\text{eff}'}) \mp (C_{10} - C'_{10}) + 2\hat{m}_b(C_7^{\text{eff}} - C_7^{\text{eff}'}) \right] \xi_{\parallel}(E_{K^*}),$$

where  $\hat{s} = q^2/m_B^2$ ,  $\hat{m}_i = m_i/m_B$ . The  $\xi_{\parallel,\perp}$  are the soft form factors.

## Link to effective operators

⇒ The observables  $S_i$  are bilinear combinations of transversity amplitudes:  $A_{\perp}^{L,R}$ ,  $A_{\parallel}^{L,R}$ ,  $A_0^{L,R}$ .

⇒ So here is where the magic happens. At leading order the amplitudes can be written as:

$$A_{\perp}^{L,R} = \sqrt{2}Nm_B(1 - \hat{s}) \left[ (C_9^{\text{eff}} + C_9^{\text{eff}'}) \mp (C_{10} + C'_{10}) + \frac{2\hat{m}_b}{\hat{s}} (C_7^{\text{eff}} + C_7^{\text{eff}'}) \right] \xi_{\perp}(E_{K^*})$$

$$A_{\parallel}^{L,R} = -\sqrt{2}Nm_B(1 - \hat{s}) \left[ (C_9^{\text{eff}} - C_9^{\text{eff}'}) \mp (C_{10} - C'_{10}) + \frac{2\hat{m}_b}{\hat{s}} (C_7^{\text{eff}} - C_7^{\text{eff}'}) \right] \xi_{\perp}(E_{K^*})$$

$$A_0^{L,R} = -\frac{Nm_B(1 - \hat{s})^2}{2\hat{m}_{K^*}\sqrt{\hat{s}}} \left[ (C_9^{\text{eff}} - C_9^{\text{eff}'}) \mp (C_{10} - C'_{10}) + 2\hat{m}_b(C_7^{\text{eff}} - C_7^{\text{eff}'}) \right] \xi_{\parallel}(E_{K^*}),$$

where  $\hat{s} = q^2/m_B^2$ ,  $\hat{m}_i = m_i/m_B$ . The  $\xi_{\parallel,\perp}$  are the soft form factors.

⇒ Now we can construct observables that cancel the  $\xi$  soft form factors at leading order:

$$P'_5 = \frac{S_5 + \bar{S}_5}{2\sqrt{F_L(1 - F_L)}}$$

- Signal modelled by a sum of two Crystal-Ball functions.
  - Shape is defined using  $B \rightarrow J/\psi K^*$  and corrected for  $q^2$  dependency.
  - Combinatorial background modelled by exponent.
- $K\pi$  system:
    - Beside the  $K^*$  resonance there might be a tail from other higher mass states.
    - We modelled it in the analysis.
    - Reduced the systematic compared to previous analysis.
- In total we found  $2398 \pm 57$  candidates in the  $(0.1, 19) \text{ GeV}^2/c^4$   $q^2$  region.
  - $624 \pm 30$  candidates in the theoretically the most interesting  $(1.1 - 6.0) \text{ GeV}^2/c^4$  region.

- Detector distorts our angular distribution.
- We need to model this effect.
- Full 4D function is used:

$$\epsilon(\cos \theta_l, \cos \theta_k, \phi, q^2) =$$

$$\sum_{ijkl} c_{ijkl} P_i(\cos \theta_l) P_j(\cos \theta_k) P_k(\phi) P_l(q^2),$$

where  $P_i$  is the Legendre polynomial of order  $i$ .

- We use up to 4<sup>th</sup>, 5<sup>th</sup>, 6<sup>th</sup>, 5<sup>th</sup> order for the  $\cos \theta_l, \cos \theta_k, \phi, q^2$ .
- 600 terms in total!

- We tested our unfolding procedure on  $B \rightarrow J/\psi K^*$ .
- The result is in perfect agreement with other experiments and our different analysis of this decay.

- Tension gets confirmed!
- The two bins deviate by 2.8 and 3.0  $\sigma$  from the SM prediction.
- Result compatible with previous result.

- Suppressed by  $\frac{f_s}{f_d}$ .
- Cleaner because of narrow  $\phi$  resonance.
- $3.3 \sigma$  deviation in the SM in the  $1 - 6 \text{GeV}^2 / \text{c}^4$  bin.
- Angular part in agreement with the SM ( $S_5$  is not accessible).

- In total  $\sim 300$  candidates in data set.
- Decay not present in the low  $q^2$ .
- For the bins in which we have  $> 3 \sigma$  significance the forward backward asymmetry is measured for the hadronic and leptonic system.

- Challenging analysis due to bremsstrahlung.
- Migration of events modeled by MC.
- Correct for bremsstrahlung.
- Take double ratio with  $B^+ \rightarrow J/\psi K^+$  to cancel systematics.
- In  $3\text{fb}^{-1}$ , LHCb measures  $R_K = 0.745^{+0.090}_{-0.074}(\text{stat.})^{+0.036}_{-0.036}(\text{syst.})$
- Consistent with the SM at  $2.6\sigma$ .

$$R_K = \frac{\int_{q^2=1 \text{ GeV}^2/c^4}^{q^2=6 \text{ GeV}^2/c^4} (dB[B^+ \rightarrow K^+ \mu^+ \mu^-]/dq^2) dq^2}{\int_{q^2=1 \text{ GeV}^2/c^4}^{q^2=6 \text{ GeV}^2/c^4} (dB[B^+ \rightarrow K^+ e^+ e^-]/dq^2) dq^2} = 1 \pm \mathcal{O}(10^{-3})$$

- A fit prepared by S. Descotes-Genon, L. Hofer, J. Matias, J. Virto.
- The data can be explained by modifying the  $C_9$  Wilson coefficient.
- Overall there is  $> 4\sigma$  discrepancy wrt. the SM prediction.

## If not NP?

- We are not there yet!
- There might be something not taken into account in the theory.
- Resonances ( $J/\psi$ ,  $\psi(2S)$ ) tails can mimic NP effects.
- There might be some non factorizable QCD corrections.  
" However, the central value of this effect would have to be significantly larger than expected on the basis of existing estimates" D. Straub, [arXiv:1503.06199](https://arxiv.org/abs/1503.06199) .

# Grab it While it's Hot!

- ⇒ Yesterday(18.04) we shown a new preliminary result: [CERN Seminar](#)
- ⇒ We measured the ratio:

$$R_{K^*} = \frac{\mathcal{B}(B \rightarrow K^* \mu \mu)}{\mathcal{B}(B \rightarrow K^* e e)}$$

# Grab it While it's Hot!

- ⇒ Yesterday(18.04) we shown a new preliminary result: [CERN Seminar](#)
- ⇒ We measured the ratio:

$$R_{K^*} = \frac{\mathcal{B}(B \rightarrow K^* \mu \mu)}{\mathcal{B}(B \rightarrow K^* e e)}$$

⇒ Measurement performed in two  $q^2$  bins.

⇒ Normalized in double ratio to  $B \rightarrow K^* J/\psi$ .

# There is more!

- There is one other Lepton Universality Violation decay recently measured by LHCb.
- $R(D^*) = \frac{\mathcal{B}(B \rightarrow D^* \tau \nu)}{\mathcal{B}(B \rightarrow D^* \mu \nu)}$
- Clean SM prediction:  $R(D^*) = 0.252(3)$ , [PRD 85 094025 \(2012\)](#)
- LHCb result:  $R(D^*) = 0.336 \pm 0.027 \pm 0.030$
- HFAG average:  $R(D^*) = 0.322 \pm 0.022$
- $4.0 \sigma$  discrepancy wrt. SM.

# Conclusions

- Clear tensions wrt. SM predictions!
- Measurements cluster in the same direction.
- We are not opening the champagne yet!
- Still need improvement both on theory and experimental side.
- More data will shade a light on the matter.
- Time will tell if this is QCD+fluctuations or new Physics:

# Conclusions

- Clear tensions wrt. SM predictions!
- Measurements cluster in the same direction.
- We are not opening the champagne yet!
- Still need improvement both on theory and experimental side.
- More data will shade a light on the matter.
- Time will tell if this is QCD+fluctuations or new Physics:

”... when you have eliminated all the Standard Model explanations, whatever remains, however improbable, must be New Physics.”

Table 2: *Best-fit points, confidence intervals, pulls for the SM hypothesis and p-values for different one-dimensional NP scenarios.*

# If not NP?

- How about our clean  $P_i$  observables?
- The QCD cancel as mentioned only at leading order.
- Comparison to normal observables with the optimised ones.

# Transversity amplitudes

⇒ One can link the angular observables to transversity amplitudes

$$J_{1s} = \frac{(2 + \beta_\ell^2)}{4} \left[ |A_\perp^L|^2 + |A_\parallel^L|^2 + |A_\perp^R|^2 + |A_\parallel^R|^2 \right] + \frac{4m_\ell^2}{q} \operatorname{Re} \left( A_\perp^L A_\perp^{R*} + A_\parallel^L A_\parallel^{R*} \right),$$

$$J_{1c} = |A_0^L|^2 + |A_0^R|^2 + \frac{4m_\ell^2}{q} \left[ |A_t|^2 + 2\operatorname{Re}(A_0^L A_0^{R*}) \right] + \beta_\ell^2 |A_S|^2,$$

$$J_{2s} = \frac{\beta_\ell^2}{4} \left[ |A_\perp^L|^2 + |A_\parallel^L|^2 + |A_\perp^R|^2 + |A_\parallel^R|^2 \right], \quad J_{2c} = -\beta_\ell^2 \left[ |A_0^L|^2 + |A_0^R|^2 \right],$$

$$J_3 = \frac{1}{2} \beta_\ell^2 \left[ |A_\perp^L|^2 - |A_\parallel^L|^2 + |A_\perp^R|^2 - |A_\parallel^R|^2 \right], \quad J_4 = \frac{1}{\sqrt{2}} \beta_\ell^2 \left[ \operatorname{Re}(A_0^L A_\parallel^{L*} + A_0^R A_\parallel^{R*}) \right],$$

$$J_5 = \sqrt{2} \beta_\ell \left[ \operatorname{Re}(A_0^L A_\perp^{L*} - A_0^R A_\perp^{R*}) - \frac{m_\ell}{\sqrt{q^2}} \operatorname{Re}(A_\parallel^L A_S^* + A_\parallel^{R*} A_S) \right],$$

$$J_{6s} = 2\beta_\ell \left[ \operatorname{Re}(A_\parallel^L A_\perp^{L*} - A_\parallel^R A_\perp^{R*}) \right], \quad J_{6c} = 4\beta_\ell \frac{m_\ell}{\sqrt{q^2}} \operatorname{Re}(A_0^L A_S^* + A_0^{R*} A_S),$$

$$J_7 = \sqrt{2} \beta_\ell \left[ \operatorname{Im}(A_0^L A_\parallel^{L*} - A_0^R A_\parallel^{R*}) + \frac{m_\ell}{\sqrt{q^2}} \operatorname{Im}(A_\perp^L A_S^* - A_\perp^{R*} A_S) \right],$$

$$J_8 = \frac{1}{\sqrt{2}} \beta_\ell^2 \left[ \operatorname{Im}(A_0^L A_\perp^{L*} + A_0^R A_\perp^{R*}) \right], \quad J_9 = \beta_\ell^2 \left[ \operatorname{Im}(A_\parallel^{L*} A_\perp^L + A_\parallel^{R*} A_\perp^R) \right],$$

## Link to effective operators

⇒ So here is where the magic happens. At leading order the amplitudes can be written as (soft form factors):

$$A_{\perp}^{L,R} = \sqrt{2} N m_B (1 - \hat{s}) \left[ (C_9^{\text{eff}} + C_9^{\text{eff}'}) \mp (C_{10} + C'_{10}) + \frac{2\hat{m}_b}{\hat{s}} (C_7^{\text{eff}} + C_7^{\text{eff}'}) \right] \xi_{\perp}(E_{K^*})$$

$$A_{\parallel}^{L,R} = -\sqrt{2} N m_B (1 - \hat{s}) \left[ (C_9^{\text{eff}} - C_9^{\text{eff}'}) \mp (C_{10} - C'_{10}) + \frac{2\hat{m}_b}{\hat{s}} (C_7^{\text{eff}} - C_7^{\text{eff}'}) \right] \xi_{\parallel}(E_{K^*})$$

$$A_0^{L,R} = -\frac{N m_B (1 - \hat{s})^2}{2\hat{m}_{K^*} \sqrt{\hat{s}}} \left[ (C_9^{\text{eff}} - C_9^{\text{eff}'}) \mp (C_{10} - C'_{10}) + 2\hat{m}_b (C_7^{\text{eff}} - C_7^{\text{eff}'}) \right] \xi_{\parallel}(E_{K^*}),$$

where  $\hat{s} = q^2/m_B^2$ ,  $\hat{m}_i = m_i/m_B$ . The  $\xi_{\parallel,\perp}$  are the form factors.

## Link to effective operators

⇒ So here is where the magic happens. At leading order the amplitudes can be written as (soft form factors):

$$A_{\perp}^{L,R} = \sqrt{2} N m_B (1 - \hat{s}) \left[ (C_9^{\text{eff}} + C_9^{\text{eff}'}) \mp (C_{10} + C'_{10}) + \frac{2\hat{m}_b}{\hat{s}} (C_7^{\text{eff}} + C_7^{\text{eff}'}) \right] \xi_{\perp}(E_{K^*})$$

$$A_{\parallel}^{L,R} = -\sqrt{2} N m_B (1 - \hat{s}) \left[ (C_9^{\text{eff}} - C_9^{\text{eff}'}) \mp (C_{10} - C'_{10}) + \frac{2\hat{m}_b}{\hat{s}} (C_7^{\text{eff}} - C_7^{\text{eff}'}) \right] \xi_{\perp}(E_{K^*})$$

$$A_0^{L,R} = -\frac{N m_B (1 - \hat{s})^2}{2\hat{m}_{K^*} \sqrt{\hat{s}}} \left[ (C_9^{\text{eff}} - C_9^{\text{eff}'}) \mp (C_{10} - C'_{10}) + 2\hat{m}_b (C_7^{\text{eff}} - C_7^{\text{eff}'}) \right] \xi_{\parallel}(E_{K^*}),$$

where  $\hat{s} = q^2/m_B^2$ ,  $\hat{m}_i = m_i/m_B$ . The  $\xi_{\parallel,\perp}$  are the form factors.

⇒ Now we can construct observables that cancel the  $\xi$  form factors at leading order:

$$P'_5 = \frac{J_5 + \bar{J}_5}{2\sqrt{-(J_2^c + \bar{J}_2^c)(J_2^s + \bar{J}_2^s)}}$$

# $B^0 \rightarrow K^* \mu^- \mu^+$ kinematics

$\Rightarrow$  The kinematics of  $B^0 \rightarrow K^* \mu^- \mu^+$  decay is described by three angles  $\theta_l$ ,  $\theta_k$ ,  $\phi$  and invariant mass of the dimuon system ( $q^2$ ).

$\Rightarrow \cos \theta_k$ : the angle between the direction of the kaon in the  $K^*$  ( $\bar{K}^*$ ) rest frame and the direction of the  $K^*$  ( $\bar{K}^*$ ) in the  $B^0$  ( $\bar{B}^0$ ) rest frame.

$\Rightarrow \cos \theta_l$ : the angle between the direction of the  $\mu^-$  ( $\mu^+$ ) in the dimuon rest frame and the direction of the dimuon in the  $B^0$  ( $\bar{B}^0$ ) rest frame.

$\Rightarrow \phi$ : the angle between the plane containing the  $\mu^-$  and  $\mu^+$  and the plane containing the kaon and pion from the  $K^*$ .

(a)  $\theta_k$  and  $\theta_l$  definitions for the  $B^0$  decay

(b)  $\phi$  definition for the  $B^0$  decay

(c)  $\phi$  definition for the  $\bar{B}^0$  decay

## $B^0 \rightarrow K^* \mu^- \mu^+$ kinematics

$\Rightarrow$  The kinematics of  $B^0 \rightarrow K^* \mu^- \mu^+$  decay is described by three angles  $\theta_l, \theta_k, \phi$  and invariant mass of the dimuon system ( $q^2$ ).

$$\begin{aligned} \frac{d^4 \Gamma}{dq^2 d\cos \theta_K d\cos \theta_l d\phi} &= \frac{9}{32\pi} \left[ J_{1s} \sin^2 \theta_K + J_{1c} \cos^2 \theta_K + (J_{2s} \sin^2 \theta_K + J_{2c} \cos^2 \theta_K) \cos 2\theta_l \right. \\ &+ J_3 \sin^2 \theta_K \sin^2 \theta_l \cos 2\phi + J_4 \sin 2\theta_K \sin 2\theta_l \cos \phi + J_5 \sin 2\theta_K \sin \theta_l \cos \phi \\ &+ (J_{6s} \sin^2 \theta_K + J_{6c} \cos^2 \theta_K) \cos \theta_l + J_7 \sin 2\theta_K \sin \theta_l \sin \phi + J_8 \sin 2\theta_K \sin 2\theta_l \sin \phi \\ &\left. + J_9 \sin^2 \theta_K \sin^2 \theta_l \sin 2\phi \right], \end{aligned}$$

$\Rightarrow$  This is the most general expression of this kind of decay.

$\Rightarrow$  The  $CP$  averaged angular observables are defined:

$$S_i = \frac{J_i + \bar{J}_i}{(d\Gamma + d\bar{\Gamma})/dq^2}$$

## Link to effective operators

⇒ The observables  $J_i$  are bilinear combinations of transversity amplitudes:  $A_{\perp}^{L,R}$ ,  $A_{\parallel}^{L,R}$ ,  $A_0^{L,R}$ .

⇒ So here is where the magic happens. At leading order the amplitudes can be written as:

$$A_{\perp}^{L,R} = \sqrt{2}Nm_B(1 - \hat{s}) \left[ (C_9^{\text{eff}} + C_9^{\text{eff}'}) \mp (C_{10} + C'_{10}) + \frac{2\hat{m}_b}{\hat{s}}(C_7^{\text{eff}} + C_7^{\text{eff}'}) \right] \xi_{\perp}(E_{K^*})$$

$$A_{\parallel}^{L,R} = -\sqrt{2}Nm_B(1 - \hat{s}) \left[ (C_9^{\text{eff}} - C_9^{\text{eff}'}) \mp (C_{10} - C'_{10}) + \frac{2\hat{m}_b}{\hat{s}}(C_7^{\text{eff}} - C_7^{\text{eff}'}) \right] \xi_{\perp}(E_{K^*})$$

$$A_0^{L,R} = -\frac{Nm_B(1 - \hat{s})^2}{2\hat{m}_{K^*}\sqrt{\hat{s}}} \left[ (C_9^{\text{eff}} - C_9^{\text{eff}'}) \mp (C_{10} - C'_{10}) + 2\hat{m}_b(C_7^{\text{eff}} - C_7^{\text{eff}'}) \right] \xi_{\parallel}(E_{K^*}),$$

where  $\hat{s} = q^2/m_B^2$ ,  $\hat{m}_i = m_i/m_B$ . The  $\xi_{\parallel,\perp}$  are the soft form factors.

## Link to effective operators

⇒ The observables  $J_i$  are bilinear combinations of transversity amplitudes:  $A_{\perp}^{L,R}$ ,  $A_{\parallel}^{L,R}$ ,  $A_0^{L,R}$ .

⇒ So here is where the magic happens. At leading order the amplitudes can be written as:

$$A_{\perp}^{L,R} = \sqrt{2} N m_B (1 - \hat{s}) \left[ (c_9^{\text{eff}} + c_9^{\text{eff}'}) \mp (c_{10} + c'_{10}) + \frac{2\hat{m}_b}{\hat{s}} (c_7^{\text{eff}} + c_7^{\text{eff}'}) \right] \xi_{\perp}(E_{K^*})$$

$$A_{\parallel}^{L,R} = -\sqrt{2} N m_B (1 - \hat{s}) \left[ (c_9^{\text{eff}} - c_9^{\text{eff}'}) \mp (c_{10} - c'_{10}) + \frac{2\hat{m}_b}{\hat{s}} (c_7^{\text{eff}} - c_7^{\text{eff}'}) \right] \xi_{\perp}(E_{K^*})$$

$$A_0^{L,R} = -\frac{N m_B (1 - \hat{s})^2}{2\hat{m}_{K^*} \sqrt{\hat{s}}} \left[ (c_9^{\text{eff}} - c_9^{\text{eff}'}) \mp (c_{10} - c'_{10}) + 2\hat{m}_b (c_7^{\text{eff}} - c_7^{\text{eff}'}) \right] \xi_{\parallel}(E_{K^*}),$$

where  $\hat{s} = q^2/m_B^2$ ,  $\hat{m}_i = m_i/m_B$ . The  $\xi_{\parallel,\perp}$  are the soft form factors.

⇒ Now we can construct observables that cancel the  $\xi$  soft form factors at leading order:

$$P'_5 = \frac{J_5 + \bar{J}_5}{2\sqrt{-(J_2^c + \bar{J}_2^c)(J_2^s + \bar{J}_2^s)}}$$

## Symmetries in $B \rightarrow K^* \mu \mu$

⇒ We have 12 angular coefficients ( $S_i$ ).

⇒ There exist 4 symmetry transformations that leave the angular distributions unchanged:

$$n_{\parallel} = \begin{pmatrix} A_{\parallel}^L \\ A_{R^*}^L \end{pmatrix}, \quad n_{\perp} = \begin{pmatrix} A_{\perp}^L \\ -A_{\perp}^L \end{pmatrix}, \quad n_0 = \begin{pmatrix} A_0^L \\ A_0^L \end{pmatrix}.$$

$$n_i' = U n_i = \begin{bmatrix} e^{i\phi_L} & 0 \\ 0 & e^{-i\phi_R} \end{bmatrix} \begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix} \begin{bmatrix} \cosh i\tilde{\theta} & -\sinh i\tilde{\theta} \\ -\sinh i\tilde{\theta} & \cosh i\tilde{\theta} \end{bmatrix} n_i.$$

⇒ Using this symmetries one can show that there are 8 independent observables. The pdf can be written as:

$$\frac{1}{d(\Gamma + \bar{\Gamma})/dq^2} \frac{d(\Gamma + \bar{\Gamma})}{d\cos\theta_l d\cos\theta_k d\phi} \Big|_P = \frac{9}{32\pi} \left[ \frac{3}{4}(1 - F_L) \sin^2 \theta_k \right. \\ + F_L \cos^2 \theta_k + \frac{1}{4}(1 - F_L) \sin^2 \theta_k \cos 2\theta_l \\ - F_L \cos^2 \theta_k \cos 2\theta_l + S_3 \sin^2 \theta_k \sin^2 \theta_l \cos 2\phi \\ + S_4 \sin 2\theta_k \sin 2\theta_l \cos \phi + S_5 \sin 2\theta_k \sin \theta_l \cos \phi \\ + \frac{4}{3} A_{\text{FB}} \sin^2 \theta_k \cos \theta_l + S_7 \sin 2\theta_k \sin \theta_l \sin \phi \\ \left. + S_8 \sin 2\theta_k \sin 2\theta_l \sin \phi + S_9 \sin^2 \theta_k \sin^2 \theta_l \sin 2\phi \right].$$

- Thanks to Method of Moments there was the possibility to measure a new observable  $S_{6c}$ .

- Measurement is consistent with the SM prediction.

- With the full data set ( $3\text{fb}^{-1}$ ) we performed angular analysis in  $0.0004 < q^2 < 1 \text{ GeV}^2/c^4$ .
- Electrons channels are extremely challenging experimentally:
  - Bremsstrahlung.
  - Trigger efficiencies.
- Determine the angular observables:  $F_L$ ,  $A_T^{(2)}$ ,  $A_T^{\text{Re}}$ ,  $A_T^{\text{Im}}$ :
- Results in full agreement with the SM.
- Similar strength on  $C_7$  Wilson coefficient as from  $b \rightarrow s\gamma$  decays.
