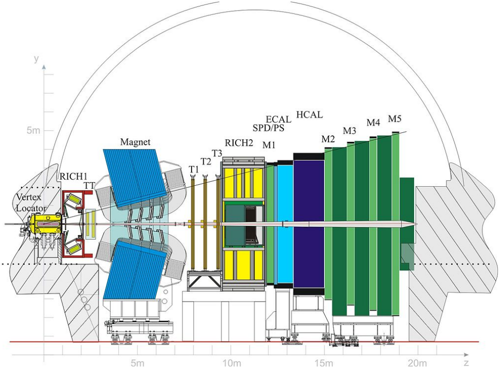
Electroweak penguin measurements

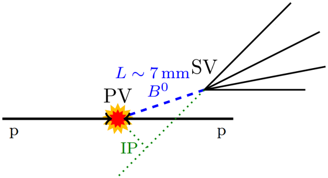
Marcin Chrząszcz
mchrzasz@cern.ch

University of Zurich[UZH]

5^{th} KEK Flavour Factory Workshop
October 26-27, 2015

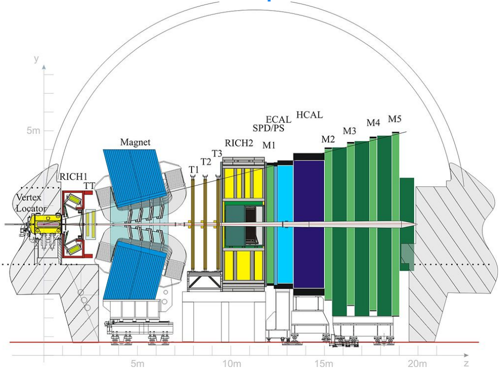
LHCb detector - tracking

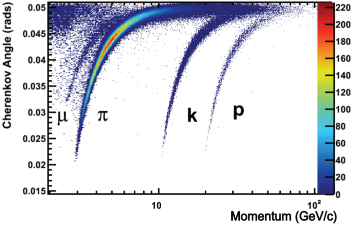




- Excellent Impact Parameter (IP) resolution ($20\ \mu$m).
  $\Rightarrow$ Identify secondary vertices from heavy flavour decays
- Proper time resolution $\sim\ 40$ fs.
  $\Rightarrow$ Good separation of primary and secondary vertices.
- Excellent momentum ($\delta p/p \sim 0.4 - 0.6\%$) and inv. mass resolution.
  $\Rightarrow$ Low combinatorial background.

LHCb detector - particle identification





- Excellent Muon identification $\epsilon_{\mu\to\mu} \sim 97\%$, $\epsilon_{\pi\to\mu} \sim 1-3\%$
- Good $K-\pi$ separation via RICH detectors, $\epsilon_{K\to K} \sim 95\%$, $\epsilon_{\pi\to K} \sim 5\%$.
  $\Rightarrow$ Reject peaking backgrounds.
- High trigger efficiencies, low momentum thresholds. Muons: $p_T > 1.76\text{GeV}$ at L0, $p_T > 1.0\text{GeV}$ at HLT1, $B \to J/\psi X$: Trigger $\sim 90\%$.

Recent measurements

⇛ Branching fractions:

$B^{0,\pm} \to K^{0,\pm}\mu^-\mu^+$ LHCb, Mar 14

$B^0 \to K^*\mu^-\mu^+$ CMS, Jul 15

$B_s^0 \to \phi\mu^-\mu^+$ LHCb, Jun 15

$B^\pm \to \pi^\pm\mu^-\mu^+$ LHCb, Sep 15

$\Lambda_b \to \Lambda\mu^-\mu^+$ LHCb, Mar 15

$B \to \mu^-\mu^+$ CMS+LHCb, Jun 15

⇛ CP asymmetry:

$B^\pm \to \pi^\pm\mu^-\mu^+$ LHCb, Sep 15

⇛ Isospin asymmetry:

$B \to K\mu^-\mu^+$ LHCb, Mar 14

⇛ Lepton Universality:

$B^\pm \to K^\pm\ell\bar{\ell}$ LHCb, Jun 14

⇛ Angular:

$B^0 \to K^*\ell\bar{\ell}$ LHCb, Jan 15

$B^\pm \to K^{*,\pm}\ell\bar{\ell}$ BaBar, Aug 15

$B_s^0 \to \phi\ell\bar{\ell}$ LHCb, Jun 15

$\Lambda_b \to \Lambda\mu^-\mu^+$ LHCb, Mar 15

$\Lambda_b \to \Lambda\mu^-\mu^+$ LHCb, Mar 15

$> 2\ \sigma$ deviations from SM

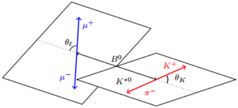
$B^0 \to K^{*}\mu^{-}\mu^{+}$ kinematics

$\Rrightarrow$ The kinematics of $B^0 \to K^{*}\mu^{-}\mu^{+}$ decay is described by three angles θ_l, θ_k, ϕ and invariant mass of the dimuon system (q^2).

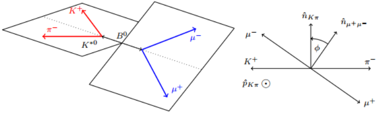
$\Rrightarrow$ $\cos\theta_k$: the angle between the direction of the kaon in the K^* ($\overline{K^*}$) rest frame and the direction of the K^* ($\overline{K^*}$) in the B^0 ($\overline{B}^0$) rest frame.

$\Rrightarrow$ $\cos\theta_l$: the angle between the direction of the μ^- (μ^+) in the dimuon rest frame and the direction of the dimuon in the B^0 ($\overline{B}^0$) rest frame.

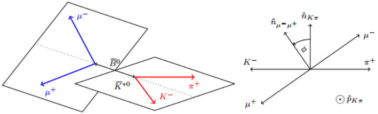
$\Rrightarrow$ ϕ: the angle between the plane containing the μ^- and μ^+ and the plane containing the kaon and pion from the K^*.



(a) θ_K and θ_ℓ definitions for the B^0 decay



(b) ϕ definition for the B^0 decay



(c) ϕ definition for the $\overline{B}^0$ decay

$B^0 \to K^*\mu^-\mu^+$ kinematics

$\Rrightarrow$ The kinematics of $B^0 \to K^*\mu^-\mu^+$ decay is described by three angles θ_l, θ_k, ϕ and invariant mass of the dimuon system (q^2).

$$\frac{d^4\Gamma}{dq^2\, d\cos\theta_K\, d\cos\theta_l\, d\phi} = \frac{9}{32\pi}\Big[J_{1s}\sin^2\theta_K + J_{1c}\cos^2\theta_K + (J_{2s}\sin^2\theta_K + J_{2c}\cos^2\theta_K)\cos 2\theta_l$$
$$+J_3\sin^2\theta_K\sin^2\theta_l\cos 2\phi + J_4\sin 2\theta_K\sin 2\theta_l\cos\phi + J_5\sin 2\theta_K\sin\theta_l\cos\phi$$
$$+(J_{6s}\sin^2\theta_K + J_{6c}\cos^2\theta_K)\cos\theta_l + J_7\sin 2\theta_K\sin\theta_l\sin\phi + J_8\sin 2\theta_K\sin 2\theta_l\sin\phi$$
$$+J_9\sin^2\theta_K\sin^2\theta_l\sin 2\phi\Big], \tag{1}$$

$\Rrightarrow$ This is the most general expression of this kind of decay.

$\Rrightarrow$ The CP averaged angular observables are defined:

$$S_i = \frac{J_i + \bar{J}_i}{(d\Gamma + d\bar{\Gamma})/dq^2} \tag{2}$$

Transversity amplitudes

⇛ One can link the angular observables to transversity amplitudes

$$
\begin{aligned}
J_{1s} &= \frac{(2+\beta_\ell^2)}{4}\left[|A_\perp^L|^2 + |A_\parallel^L|^2 + |A_\perp^R|^2 + |A_\parallel^R|^2\right] + \frac{4m_\ell^2}{q^2}\mathrm{Re}\left(A_\perp^L A_\perp^{R\,*} + A_\parallel^L A_\parallel^{R\,*}\right)\,, \\
J_{1c} &= |A_0^L|^2 + |A_0^R|^2 + \frac{4m_\ell^2}{q^2}\left[|A_t|^2 + 2\mathrm{Re}(A_0^L A_0^{R\,*})\right] + \beta_\ell^2\,|A_S|^2\,, \\
J_{2s} &= \frac{\beta_\ell^2}{4}\left[|A_\perp^L|^2 + |A_\parallel^L|^2 + |A_\perp^R|^2 + |A_\parallel^R|^2\right], \qquad J_{2c} = -\beta_\ell^2\left[|A_0^L|^2 + |A_0^R|^2\right]\,, \\
J_3 &= \frac{1}{2}\beta_\ell^2\left[|A_\perp^L|^2 - |A_\parallel^L|^2 + |A_\perp^R|^2 - |A_\parallel^R|^2\right], \qquad J_4 = \frac{1}{\sqrt{2}}\beta_\ell^2\left[\mathrm{Re}(A_0^L A_\parallel^{L\,*} + A_0^R A_\parallel^{R\,*})\right], \\
J_5 &= \sqrt{2}\beta_\ell\left[\mathrm{Re}(A_0^L A_\perp^{L\,*} - A_0^R A_\perp^{R\,*}) - \frac{m_\ell}{\sqrt{q^2}}\,\mathrm{Re}(A_\parallel^L A_S^* + A_\parallel^{R\,*} A_S)\right], \\
J_{6s} &= 2\beta_\ell\left[\mathrm{Re}(A_\parallel^L A_\perp^{L\,*} - A_\parallel^R A_\perp^{R\,*})\right]\,, \qquad J_{6c} = 4\beta_\ell\,\frac{m_\ell}{\sqrt{q^2}}\,\mathrm{Re}(A_0^L A_S^* + A_0^{R\,*} A_S)\,, \\
J_7 &= \sqrt{2}\beta_\ell\left[\mathrm{Im}(\mathrm{A_0^L A_\parallel^{L\,*} - A_0^R A_\parallel^{R\,*}}) + \frac{\mathrm{m}_\ell}{\sqrt{\mathrm{q}^2}}\,\mathrm{Im}(\mathrm{A_\perp^L A_S^* - A_\perp^{R\,*} A_S})\right)\Big]\,, \\
J_8 &= \frac{1}{\sqrt{2}}\beta_\ell^2\left[\mathrm{Im}(\mathrm{A_0^L A_\perp^{L\,*} + A_0^R A_\perp^{R\,*}})\right]\,, \qquad J_9 = \beta_\ell^2\left[\mathrm{Im}(\mathrm{A_\parallel^{L\,*} A_\perp^L + A_\parallel^{R\,*} A_\perp^R})\right]\,, \qquad (3)
\end{aligned}
$$

Link to effective operators

$\Rrightarrow$ So here is where the magic happens. At leading order the amplitudes can be written as:

$$
\begin{aligned}
A_{\perp}^{L,R} &= \sqrt{2}Nm_B(1-\hat{s})\left[(\mathcal{C}_9^{\text{eff}}+\mathcal{C}_9^{\text{eff}\prime})\mp(\mathcal{C}_{10}+\mathcal{C}_{10}^{\prime})+\frac{2\hat{m}_b}{\hat{s}}(\mathcal{C}_7^{\text{eff}}+\mathcal{C}_7^{\text{eff}\prime})\right]\xi_{\perp}(E_{K^*}) \\
A_{\parallel}^{L,R} &= -\sqrt{2}Nm_B(1-\hat{s})\left[(\mathcal{C}_9^{\text{eff}}-\mathcal{C}_9^{\text{eff}\prime})\mp(\mathcal{C}_{10}-\mathcal{C}_{10}^{\prime})+\frac{2\hat{m}_b}{\hat{s}}(\mathcal{C}_7^{\text{eff}}-\mathcal{C}_7^{\text{eff}\prime})\right]\xi_{\perp}(E_{K^*}) \\
A_{0}^{L,R} &= -\frac{Nm_B(1-\hat{s})^2}{2\hat{m}_{K^*}\sqrt{\hat{s}}}\left[(\mathcal{C}_9^{\text{eff}}-\mathcal{C}_9^{\text{eff}\prime})\mp(\mathcal{C}_{10}-\mathcal{C}_{10}^{\prime})+2\hat{m}_b(\mathcal{C}_7^{\text{eff}}-\mathcal{C}_7^{\text{eff}\prime})\right]\xi_{\parallel}(E_{K^*}), \qquad (4)
\end{aligned}
$$

where $\hat{s}=q^2/m_B^2$, $\hat{m}_i=m_i/m_B$. The $\xi_{\parallel,\perp}$ are the form factors.

Link to effective operators

$\Rrightarrow$ So here is where the magic happens. At leading order the amplitudes can be written as:

$$
\begin{aligned}
A_{\perp}^{L,R} &= \sqrt{2} N m_B (1-\hat{s}) \left[(\mathcal{C}_9^{\rm eff} + \mathcal{C}_9^{\rm eff\prime}) \mp (\mathcal{C}_{10} + \mathcal{C}_{10}^{\prime}) + \frac{2\hat{m}_b}{\hat{s}} (\mathcal{C}_7^{\rm eff} + \mathcal{C}_7^{\rm eff\prime}) \right] \xi_{\perp}(E_{K^*}) \\
A_{\parallel}^{L,R} &= -\sqrt{2} N m_B (1-\hat{s}) \left[(\mathcal{C}_9^{\rm eff} - \mathcal{C}_9^{\rm eff\prime}) \mp (\mathcal{C}_{10} - \mathcal{C}_{10}^{\prime}) + \frac{2\hat{m}_b}{\hat{s}} (\mathcal{C}_7^{\rm eff} - \mathcal{C}_7^{\rm eff\prime}) \right] \xi_{\perp}(E_{K^*}) \\
A_{0}^{L,R} &= -\frac{N m_B (1-\hat{s})^2}{2\hat{m}_{K^*}\sqrt{\hat{s}}} \left[(\mathcal{C}_9^{\rm eff} - \mathcal{C}_9^{\rm eff\prime}) \mp (\mathcal{C}_{10} - \mathcal{C}_{10}^{\prime}) + 2\hat{m}_b (\mathcal{C}_7^{\rm eff} - \mathcal{C}_7^{\rm eff\prime}) \right] \xi_{\parallel}(E_{K^*}),
\end{aligned}
\tag{4}
$$

where $\hat{s} = q^2/m_B^2$, $\hat{m}_i = m_i/m_B$. The $\xi_{\parallel,\perp}$ are the form factors.

$\Rrightarrow$ Now we can construct observables that cancel the ξ form factors at leading order:

$$
P_5^{\prime} = \frac{J_5 + \bar{J}_5}{2\sqrt{-(J_2^c + \bar{J}_2^c)(J_2^s + \bar{J}_2^s)}}
\tag{5}
$$

Symmetries in $B \to K^{*}\mu\mu$

$\Rightarrow$ Eq. **??** has 12 angular coefficients.
$\Rightarrow$ There exists 4 symmetry transformations that leave the angular distributions non changed:

$$n_{\parallel} = \begin{pmatrix} A_{\parallel}^{L} \\ A_{\parallel}^{R*} \end{pmatrix}, \quad n_{\perp} = \begin{pmatrix} A_{\perp}^{L} \\ -A_{\perp}^{R*} \end{pmatrix}, \quad n_{0} = \begin{pmatrix} A_{0}^{L} \\ A_{0}^{R*} \end{pmatrix}. \tag{6}$$

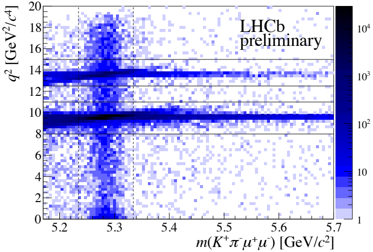
$$n_i^{'} = U n_i = \begin{bmatrix} e^{i\phi_L} & 0 \\ 0 & e^{-i\phi_R} \end{bmatrix} \begin{bmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{bmatrix} \begin{bmatrix} \cosh i\tilde{\theta} & -\sinh i\tilde{\theta} \\ -\sinh i\tilde{\theta} & \cosh i\tilde{\theta} \end{bmatrix} n_i . \tag{7}$$

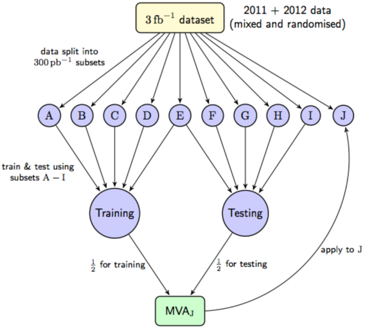
$\Rightarrow$ Using this symmetries one can show that there are 8 independent observables. The pdf can be wrote as:

$$\begin{aligned} \frac{1}{\mathrm{d}(\Gamma+\bar{\Gamma})/\mathrm{d}q^2} \frac{\mathrm{d}(\Gamma+\bar{\Gamma})}{\mathrm{d}\cos\theta_l \, \mathrm{d}\cos\theta_k \, \mathrm{d}\phi}\Bigg|_{\mathrm{P}} = \frac{9}{32\pi} \Big[& \tfrac{3}{4}(1-F_{\mathrm{L}})\sin^2\theta_k \\ & + F_{\mathrm{L}}\cos^2\theta_k + \tfrac{1}{4}(1-F_{\mathrm{L}})\sin^2\theta_k \cos 2\theta_l \\ & - F_{\mathrm{L}}\cos^2\theta_k \cos 2\theta_l + S_3 \sin^2\theta_k \sin^2\theta_l \cos 2\phi \\ & + S_4 \sin 2\theta_k \sin 2\theta_l \cos\phi + S_5 \sin 2\theta_k \sin\theta_l \cos\phi \\ & + \tfrac{4}{3} A_{\mathrm{FB}} \sin^2\theta_k \cos\theta_l + S_7 \sin 2\theta_k \sin\theta_l \sin\phi \\ & + S_8 \sin 2\theta_k \sin 2\theta_l \sin\phi + S_9 \sin^2\theta_k \sin^2\theta_l \sin 2\phi \Big]. \end{aligned} \tag{8}$$

LHCb update of the $B^0 \to K^*\mu^-\mu^+$, Selection

- PID, kinematics and isolation variables used in a Boosted Decision Tree (BDT) to discriminate signal and background.
- Reject the regions of J/ψ and $\psi(2S)$.
- Specific vetos for backgrounds: $\Lambda_b \to pK\mu\mu$, $B_s^0 \to \phi\mu\mu$, etc.
- Using k-Fold technique and signal proxy $B \to J/\psi K^*$ for training the BDT.
- Improved selection allowed for finer binning than the $1\mathrm{fb}^{-1}$ analysis.

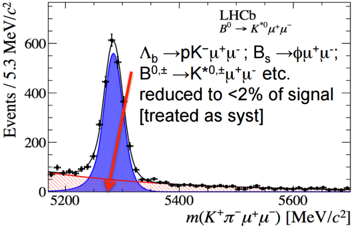




LHCb update of the $B^0 \to K^* \mu^- \mu^+$, Selection

- Signal modelled by a sum of two Crystal-Ball functions.
- Shape is defined using $B \to J/\psi K^*$ and corrected for q^2 dependency.
- Combinatorial background modelled by exponent.

- $K\pi$ system:
  - Rel. Breit Wigner for P-wave
  - Lass model for the S-wave.
  - Linear model for background.



- In total we found 2398 ± 57 candidates in the $(0.1, 19)\ \mathrm{GeV}^2$ q^2 region.
- 624 ± 30 candidates in the theoretically the most interesting $(1.1 - 6.0)\ \mathrm{GeV}^2$ region.

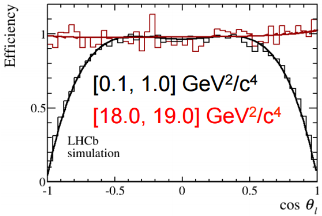
Detector acceptance

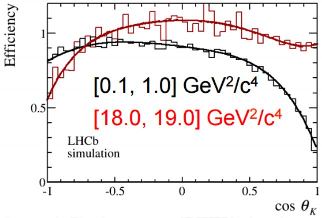
- Detector distorts our angular distribution.
- We need to model this effect.
- 4D function is used:

$$\epsilon(\cos\theta_l, \cos\theta_k, \phi, q^2) = \sum_{ijkl} c_{ijkl} P_i(\cos\theta_l) P_j(\cos\theta_k) P_k(\phi) P_l(q^2),$$

where P_i is the Legendre polynomial of order i.

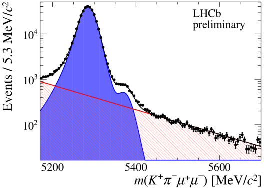
- We use up to $4^{th}, 5^{th}, 6^{th}, 5^{th}$ order for the $\cos\theta_l, \cos\theta_k, \phi, q^2$.

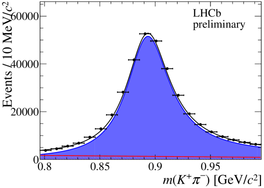


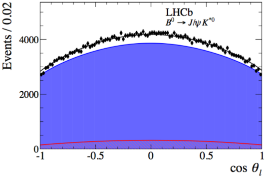


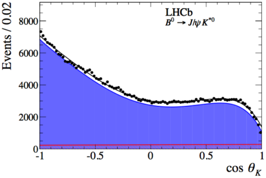
Control channel

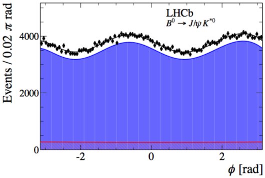
- We tested our unfolding procedure on $B \to J/\psi K^*$.
- The result is in perfect agreement with other experiments and our different analysis of this decay.



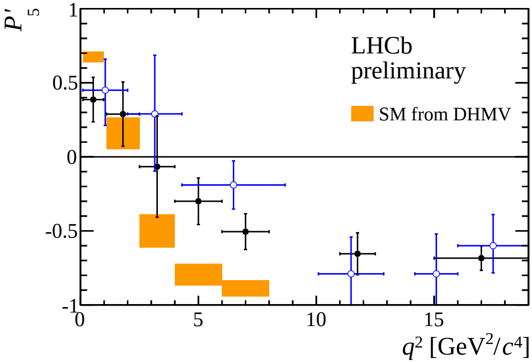






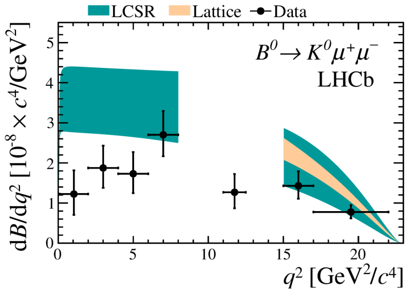


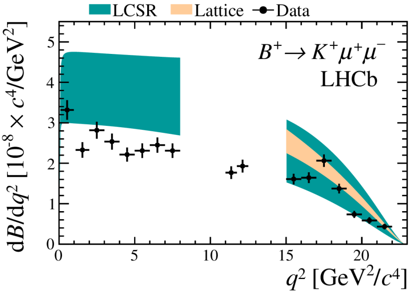
Results in $B \to K^*\mu\mu$



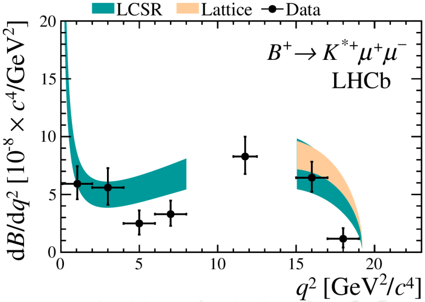
- Tension with $3\ \mathrm{fb}^{-1}$ gets confirmed!
- The two bins deviate both in $2.8\ \sigma$ from SM prediction.
- Result compatible with previous result.

Branching fraction measurements of $B \to K^{*\pm}\mu\mu$

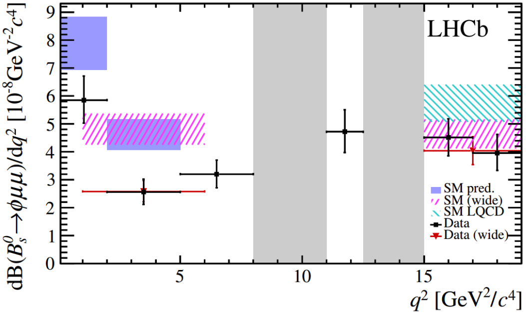




- Despite large theoretical errors the results are consistently smaller then SM prediction.

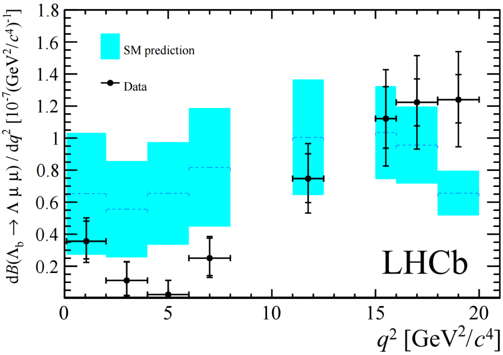


Branching fraction measurements of $B_s^0 \to \phi\mu\mu$



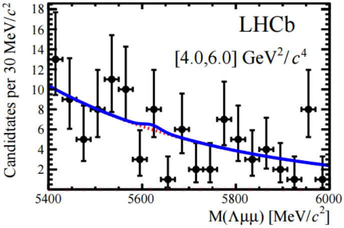
- Recent LHCb measurement [JHEPP09 (2015) 179].
- Suppressed by $\frac{f_s}{f_d}$.
- Cleaner because of narrow ϕ resonance.
- $3.3\ \sigma$ deviation in SM in the $1 - 6\mathrm{GeV}^2$ bin.

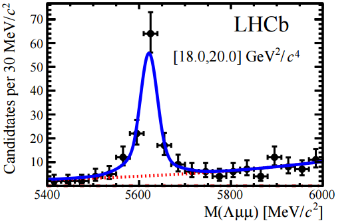
Branching fraction measurements of $\Lambda_b \to \Lambda\mu\mu$



- This years LHCb measurement [JHEP 06 (2015) 115]].
- In total ~ 300 candidates in data set.
- Decay not present in the low q^2.

Branching fraction measurements of $\Lambda_b \to \Lambda\mu\mu$

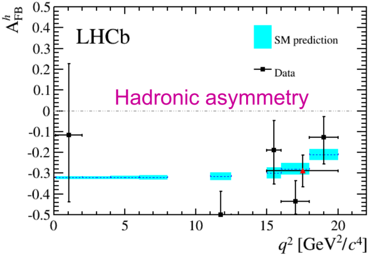


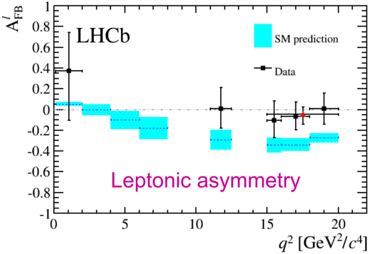


- This years LHCb measurement [JHEP 06 (2015) 115]].
- In total ~ 300 candidates in data set.
- Decay not present in the low q^2.

Angular analysis of $\Lambda_b \rightarrow \Lambda\mu\mu$

- For the bins in which we have $> 3\ \sigma$ significance the forward backward asymmetry for the hadronic and leptonic system.





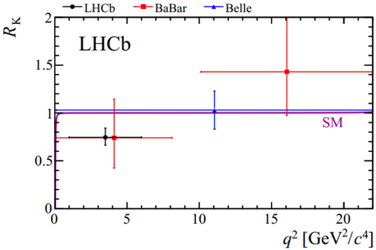
- A^H_{FB} is in good agreement with SM.
- A^ℓ_{FB} always in above SM prediction.

Lepton universality test

- If Z' is responsible for the P_5' anomaly, does it couple equally to all flavours?

$$R_K = \frac{\int_{q^2=1\,\mathrm{GeV}^2/c^4}^{q^2=6\,\mathrm{GeV}^2/c^4} (\mathrm{d}\mathcal{B}[B^+ \to K^+\mu^+\mu^-]/\mathrm{d}q^2)\mathrm{d}q^2}{\int_{q^2=1\,\mathrm{GeV}^2/c^4}^{q^2=6\,\mathrm{GeV}^2/c^4} (\mathrm{d}\mathcal{B}[B^+ \to K^+e^+e^-]/\mathrm{d}q^2)\mathrm{d}q^2} = 1 \pm \mathcal{O}(10^{-3})\,.$$

- Challenging analysis due to bremsstrahlung.
- Migration of events modeled by MC.
- Correct for bremsstrahlung.
- Take double ratio with $B^+ \to J/\psi K^+$ to cancel systematics.
- In $3\mathrm{fb}^{-1}$, LHCb measures $R_K = 0.745^{+0.090}_{-0.074}(stat.)^{+0.036}_{-0.036}(syst.)$
- Consistent with SM at 2.6σ.



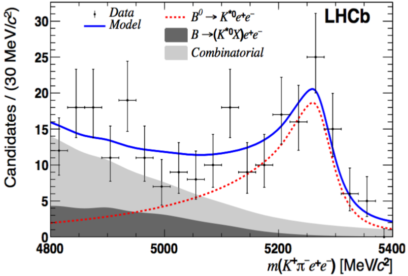
- Phys. Rev. Lett. 113, 151601 (2014)

Angular analysis of $B^0 \to K^*ee$

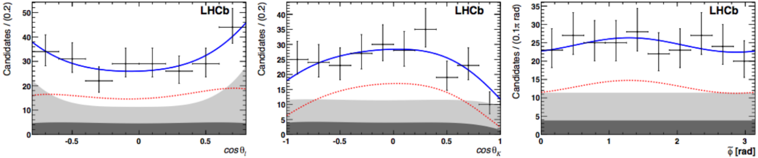
- With the full data set (3fb^{-1}) we performed angular analysis in $0.0004 < q^2 < 1\ \text{GeV}^2$.
- Electrons channels are extremely challenging experimentally:
  - Bremsstrahlung.
  - Trigger efficiencies.
- Determine the angular observables: $F_{\rm L}$, $A_{\rm T}^{(2)}$, $A_{\rm T}^{\rm Re}$, $A_{\rm T}^{\rm Im}$:

$$
\begin{aligned}
F_{\rm L} &= \frac{|A_0|^2}{|A_0|^2 + |A_{||}|^2 + |A_{\perp}|^2} \\
A_{\rm T}^{(2)} &= \frac{|A_{\perp}|^2 - |A_{||}|^2}{|A_{\perp}|^2 + |A_{||}|^2} \\
A_{\rm T}^{\rm Re} &= \frac{2\mathcal{R}e(A_{||L}A^*_{\perp L} + A_{||R}A^*_{\perp R})}{|A_{||}|^2 + |A_{\perp}|^2} \\
A_{\rm T}^{\rm Im} &= \frac{2\mathcal{I}m(A_{||L}A^*_{\perp L} + A_{||R}A^*_{\perp R})}{|A_{||}|^2 + |A_{\perp}|^2},
\end{aligned}
\tag{9}
$$

Angular analysis of $B^0 \to K^* ee$



- Results in full agreement with the SM.
- Similar strength on C_7 Wilson coefficient as from $b \to s\gamma$ decays.

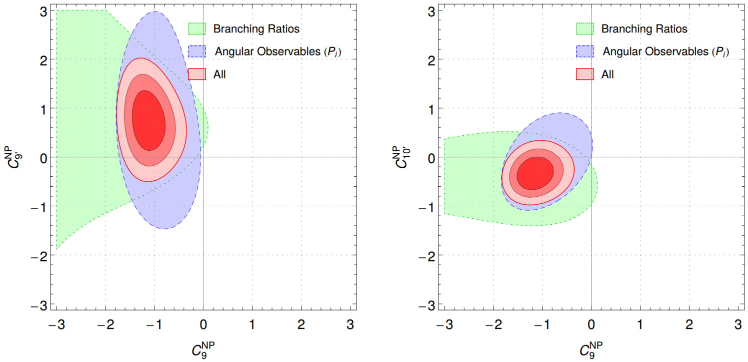


Theory implications

- A preliminary fit prepared by `S. Descotes-Genon, L. Hofer, J. Matias, J. Virto`, presented at 1510.04239
- Took into the fit:
  - $\mathcal{B}(B \to X_s\gamma) = (3.36 \pm 0.23) \times 10^{-4}$, Misiak et. al. 2015.
  - $\mathcal{B}(B \to \mu\mu)$, theory: Bobeth et al 2013, experiment: LHCb+CMS average (2015)
  - $\mathcal{B}(B \to X_s\mu\mu)$, Huber et al 2015
  - $\mathcal{B}(B \to K\mu\mu)$,Bouchard et al 2013, 2015
  - $PB_{(s)} \to K^*(\phi)\mu\mu$, Horgan et al 2013
  - $B \to Kee$, $B \to K^*ee$ and R_k.
- Overall there is around $4.5\ \sigma$ discrepancy wrt. SM.

Theory implications

- A preliminary fit prepared by `S. Descotes-Genon, L. Hofer, J. Matias, J. Virto`, presented at 1510.04239
- The data can be explained by modifying the C_9 Wilson coefficient.
- Overall there is around $4.5\ \sigma$ discrepancy wrt. SM.



Theory implications

Coefficient	Best fit	1σ	3σ	$\mathrm{Pull_{SM}}$	p-value (%)

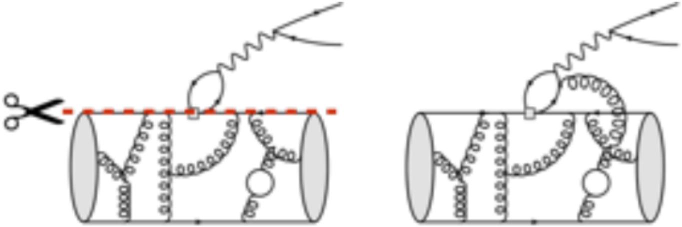
Table 2: *Best-fit points, confidence intervals, pulls for the SM hypothesis and p-values for different one-dimensional NP scenarios.*

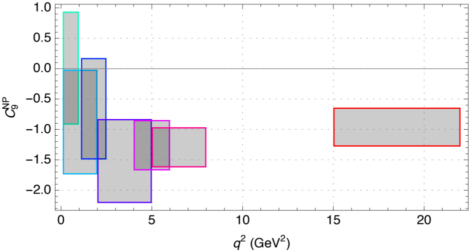
If not NP?

- We are not there yet!
- There might be something not taken into account in the theory.
- Resonances (J/ψ, $\psi(2S)$) tails can mimic NP effects.
- There might be some non factorizable QCD corrections.
  " However, the central value of this effect would have to be significantly larger than expected on the basis of existing estimates" `D.Straub, 1503.06199` .



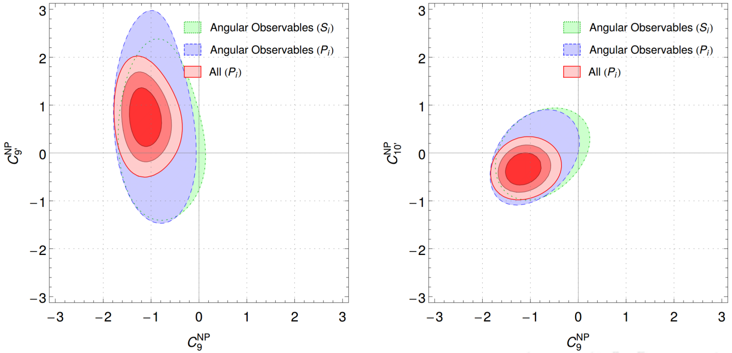
If not NP?

- We are not there yet!
- There might be something not taken into account in the theory.
- Resonances (J/ψ, $\psi(2S)$) tails can mimic NP effects.
- There might be some non factorizable QCD corrections.
  " However, the central value of this effect would have to be significantly larger than expected on the basis of existing estimates" `D.Straub, 1503.06199` .



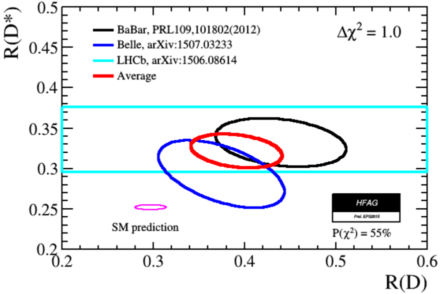
If not NP?

- How about our clean P_i observables?
- The QCD cancel as mentioned only at leading order.
- Comparison to normal observables with the optimised ones.



There is more!

- There is one other LUV decay recently measured by LHCb.
- $R(D^*) = \dfrac{\mathcal{B}(B \to D^* \tau \nu)}{\mathcal{B}(B \to D^* \mu \nu)}$
- Clean SM prediction: $R(D^*) = 0.252(3)$, PRD 85 094025 (2012)
- LHCb result: $R(D^*) = 0.336 \pm 0.027 \pm 0.030$, HFAG average: $R(D^*) = 0.322 \pm 0.022$
- $3.9\ \sigma$ discrepancy wrt. SM.



Conclusions

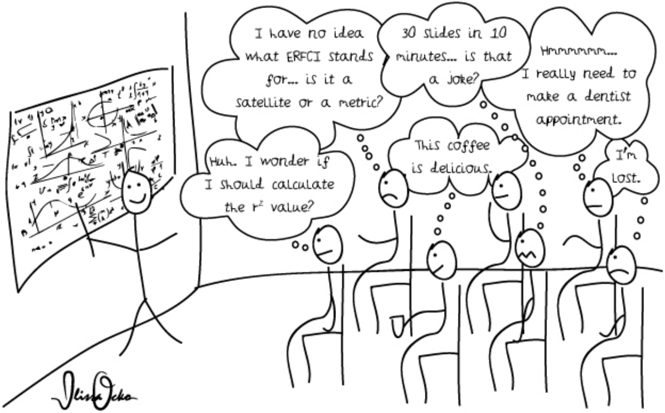
- Clear tensions wrt. SM predictions!
- Measurements cluster in the same direction.
- We are not opening the champagne yet!
- Still need improvement both on theory and experimental side.
- Time will tell if this is QCD+fluctuations or new Physics:

Conclusions

- Clear tensions wrt. SM predictions!
- Measurements cluster in the same direction.
- We are not opening the champagne yet!
- Still need improvement both on theory and experimental side.
- Time will tell if this is QCD+fluctuations or new Physics:

"... when you have eliminated all the
Standard Model explanations, whatever remains,
however improbable, must be New Physics."
prof. Joaquim Matias

Thank you for the attention!



Backup
