Comparison MoM with LL fit

rof

Comparison MoM with LL fit

rof

Expected differences, MoM vs fit

- We checked this already but as number of sigma is a bit too large for me.
- Let me put once again all the numbers I have in once place.
- Here Signal only, WITH acceptance.

| $q^2 [\text{GeV}^2/c^4]$ | absolute expected difference at 68% CL | | | | | | | |
|--------------------------|--|-------|-------|-------|-------|-------|-------|-------|
| | F_I | S_3 | S_4 | S_5 | S_6 | S_7 | S_8 | S_9 |
| 0.1 – 0.98 | 0.035 | 0.021 | 0.044 | 0.028 | 0.073 | 0.025 | 0.038 | 0.062 |
| 1.1 – 2.5 | 0.062 | 0.065 | 0.082 | 0.061 | 0.073 | 0.065 | 0.084 | 0.062 |
| 2.5 – 4.0 | 0.062 | 0.067 | 0.085 | 0.077 | 0.065 | 0.072 | 0.080 | 0.042 |
| 4.0 – 6.0 | 0.043 | 0.044 | 0.059 | 0.056 | 0.027 | 0.052 | 0.054 | 0.038 |
| 6.0 – 8.0 | 0.038 | 0.042 | 0.056 | 0.053 | 0.028 | 0.045 | 0.051 | 0.027 |
| 15.0 – 17.0 | 0.027 | 0.044 | 0.051 | 0.042 | 0.032 | 0.034 | 0.045 | 0.034 |
| 17.0 – 19.0 | 0.034 | 0.059 | 0.066 | 0.055 | 0.044 | 0.043 | 0.056 | 0.049 |

Pull distribution

- Take the observed difference ($S_x^{MoM} - S_x^{Fit}$) and divide by the expected difference from table above.

- Important note: The fit I do is weighted, but the pull was obtained using Christoph fit which is unweighed, aka we are comparing apples to oranges here.
- Now repeat the exercise with my own fit weighted fit.

Comparison MoM with LL fit

Comparison MoM with LL fit

rof

Pull distribution

- Take the observed difference ($S_x^{MoM} - S_x^{Fit}$) and divide by the expected difference from table above.

- Now oranges to oranges.

BACKUP

Comparison MoM with LL fit

- My personal opinion: Despite what is expected the left plot scares the hell out of me!

Expected differences, MoM vs fit

- We checked this already but as number of sigma is a bit too large for me.
- Let me put once again all the numbers I have in once place.
- Here Signal only, no acceptance.
